Burl W. Haar Executive Secretary Minnesota Public Utilities Commission 121 7th Place East, Suite 350 Saint Paul, Minnesota 55101-2147

RE: Comments of the Minnesota Office of Energy Security

Docket No. G011/M-09-1283

Dear Dr. Haar:

Attached are the *Comments* of the Minnesota Office of Energy Security (OES) in the following matter:

A request (*Petition*) submitted by Minnesota Energy Resources Corporation-PNG (MERC-PNG or Company) for approval of a change in demand entitlements on its Great Lakes Gas Transmission (Great Lakes) pipeline system.

The Petition was filed on November 2, 2009 by:

Greg Walters
Regulatory and Legislative Affairs Manager
Minnesota Energy Resources Corporation
519 1st Avenue SW
P.O. Box 6538
Rochester, MN 55903-6538

Based on its concerns associated with MERC-PNG's design-day calculations, the OES withholds recommendation in this proceeding until the Company provides additional information in its Reply Comments. Given these concerns, the OES recommends that MERC-PNG provide the following in its Reply Comments:

- a full discussion explaining why its heating degree day adjustment differs from the National Weather Service's calculation standard and what, if any, impact using the official wind chill calculation has on its design-day forecasts;
- a full discussion detailing how it intends to install telemetry on its transportation customers and an estimate of how long it will be before it has adequate daily data to more accurately estimate its firm design day;

Burl W. Haar March 10, 2010 Page 2

- a full discussion explaining how the Company arrived at its interruptible and transportation customer usage estimates that it incorporates into its design-day analysis;
- a full discussion of whether MERC-PNG is examining other techniques to improve its interruptible customer usage estimates;
- a full discussion explaining why it chose the 97.5 percent confidence level that it uses in its design day analysis;
- a full analysis, including supporting calculations, comparing demand costs at the 97.5 confidence level and at the 99.9 percent confidence level in its volume risk adjustment; and
- a full discussion explaining the circumstances surrounding the peak day sendout during the 2008-2009 heating season.

The OES also recommends that MERC-PNG correct the calculation error in its monthly PGA filing related to its Call Option rates as soon as possible and refund any, and all, over-recoveries associated with this error in its September 1, 2010 true-up filing.

The OES is available to answer any questions that the Commission may have.

Sincerely,

/s/ ADAM JOHN HEINEN Rates Analyst (651) 296-6329

BEFORE THE MINNESOTA PUBLIC UTILITIES COMMISSION

COMMENTS OF THE MINNESOTA OFFICE OF ENERGY SECURITY

DOCKET NO. G011/M-09-1283

I. SUMMARY OF MERC-PNG'S PROPOSAL

Pursuant to Minnesota Rules 7825.2910, subpart 2 (Filing Upon Change in Demand), on November 2, 2009, Minnesota Energy Resources Corporation-PNG (MERC-PNG or Company), submitted a demand entitlement filing (*Petition*) for its Great Lakes Gas Transmission, L.P. (GLGT or Great Lakes) pipeline system. In its *Petition*, MERC-PNG requests the Minnesota Public Utilities Commission's (Commission) approval to "change demand levels by type" on the GLGT system for service to its Minnesota firm customers. Specifically, MERC-PNG requests to change its level of overall demand entitlement (capacity). In addition, MERC-PNG requests approval to recover the associated demand costs in the monthly Purchase Gas Adjustment (PGA) effective November 1, 2009. The Minnesota Office of Energy Security (OES) provides comments supporting MERC's proposal below.

In addition, on November 2, 2009, MERC-NMU (NMU), a division of Integrys Energy, submitted a request to change demand entitlements in Docket No. G007/M-09-1282. The OES separately addresses the requests in each of these dockets.

¹ MERC-PNG also serves Minnesota customers off of the Northern Natural Gas (Northern) pipeline system and the Viking Gas Transmission (Viking) pipeline system. On November 2, 2009, MERC-PNG submitted the following requests with respect to these two systems:

[•] A request to change the Company's demand entitlements on the Northern system for the 2009-2010 heating season in Docket No. G011/M-09-1284; and

A request to change the Company's demand entitlements on the Viking system for the 2009-2010 heating season in Docket No. G011/M-09-1285.

Analyst assigned: Adam John Heinen

Page 2

II. OES ANALYSIS OF MERC-PNG'S DEMAND PROPOSAL

The OES reviewed MERC-PNG's proposed design-day requirement, proposed demand entitlement, and resulting reserve margins. Additionally, the OES compared this year's amounts with previous years' amounts. The OES's analysis of the Company's request includes three parts:

- MERC-PNG's GLGT PGA system proposed Design-Day Requirement, Demand Entitlement Level, and Reserve Margin;
- MERC-PNG's GLGT PGA system specific proposed demand entitlement changes; and
- MERC-PNG's Great Lakes PGA System Cost Recovery Proposal.
- A. MERC-PNG'S GLGT PROPOSED DESIGN-DAY REQUIREMENT, PROPOSED DEMAND ENTITLEMENT LEVEL, AND RESULTING RESERVE MARGIN
 - 1. Design-Day Requirement
 - a. Peak-Day Calculation

In its *Petition* and in response to OES discovery, MERC-PNG explained the peak-day model it uses to determine the design-day requirement and provided the model results and input data in its response to OES Information Request No. 2 (OES Attachments 1). Based on its review, the OES concludes that the MERC-PNG conducted its design-day studying using a statistically valid model. However, the OES is still concerned that the Company's design-day analysis may not ensure sufficient volumes on a peak day as defined by Commission practice. Before discussing its concerns with MERC-PNG's design-day calculations, the OES provides a brief description of the Company's design-day analysis.

MERC-PNG conducts its design-day and peak-day analyses using statistical techniques, specifically ordinary least squares (OLS) regression. The Company's regression analysis is based on daily system throughput, wind-adjusted heating degree days (AHDDs),³ and other significant independent variables (*e.g.*, month, day of the week) for the months of December through February over the past three heating seasons (*i.e.*, 2006-2007, 2007-2008, 2008-2009).⁴ This

² Minnesota Rules 7825.2400, subp. 13d, defines a design-day as: "a 24-hour-day period of the greatest possible gas requirement to meet firm customer needs." The Commission later clarified this to mean the coldest day in the previous 20 years, which on the MERC-PNG Great Lakes PGA system is -34°F or 99 HDDs.

³ Commission Staff has indicated concerns, in another utility's demand entitlement filing, about using AHDD when conducting a design-day analysis. MERC-PNG notes in its response to OES Information Request No. 3 (OES Attachment 2) that AHDDs produce more robust regression results than using non-wind aided HDDs.

⁴ The OES notes that MERC-PNG's adjusted HDD calculation is different than the official calculation used by the National Weather Service (NWS). Given this difference, the OES recommends that MERC-PNG provide, in its *Reply Comments*, a full discussion explaining why it uses a different calculation and what, if any, impact using the official wind chill calculation has on MERC-PNG's design-day forecast.

Analyst assigned: Adam John Heinen

Page 3

regression analysis allows MERC-PNG to estimate weather's (AHDDs) impact on system throughput and then compare this impact to the Company's all-time system peak day. This comparison then allows MERC-PNG to estimate total system throughput, based on current customer counts and system characteristics, if a day similar to the system's all-time peak sendout were to occur during the heating season. Finally, the Company includes a volume risk adjustment, removes interruptible and transportation customer usage, and applies a customer growth figure to its estimated total system throughput.

As noted above, while the OES concludes that MERC-PNG conducts its design-day analysis using a statistically valid technique, the OES is concerned that this analysis may not be able to fully ensure system reliability on an all-time peak day. The OES's primary concern relates to estimating peak-day firm sales throughput. To estimate peak-day firm throughput, MERC-PNG subtracts estimated use by interruptible and transportation customers from total throughput. As mentioned in MERC-PNG's Initial Petition, page 9, the Company states that it only has monthly billing cycle data for the majority of its interruptible and transportation customers. This fact creates an issue in that it requires the Company to estimate daily interruptible and transportation customer use before estimating firm sales. However, since these non-firm customers are less weather sensitive than firm customers, it is not unreasonable to assume, as MERC-PNG does, that these customers will consume roughly the same amount of gas each day. While reviewing MERC-PNG's calculation of average daily interruptible and transportation use, the OES observed that the Company bases its calculation on 20 days in the month, which indicates that MERC-PNG believes that these customers operate approximately five days a week. The OES would prefer a more precise estimate, but notes that MERC-PNG is in the process of obtaining data for a more precise estimate of peak-day use, as discussed below.

The OES conducted further peak-day analysis by comparing MERC-PNG's estimate of peak-day use by interruptible and transportation customers to total peak-day throughput estimates provided by the Company in its response to OES Information Request No. 2 (OES Attachment 1). Based on calculations made by the OES, it is possible, under certain circumstances, that the Company may not have sufficient capacity to serve firm customers on an all-time peak day. Specifically, the OES notes that there were two dates where estimated firm peak-day usage is greater than MERC-PNG's total entitlement level (OES Attachment 3). The differentials are relatively small and could be managed if such a circumstance arose. Thus, although the OES has concerns with MERC-PNG's results, the OES is confident that service would be reliable. Further, the OES does not believe that MERC-PNG is attempting to bias its estimate of interruptible and transportation use but, rather, is attempting to deal with an unknown quantity, interruptible and transportation customer use, in the best manner possible.

Further, the Company is attempting to mitigate the design-day risk associated with transportation customers by requiring gas meter telemetry. In its most recent general rate case, Docket No. G007,011/GR-08-835, MERC-PNG and MERC-NMU proposed a change in rate design requiring all transportation customers to install telemetry. In its June 29, 2009 *Order* in this rate

Analyst assigned: Adam John Heinen

Page 4

case, the Commission agreed with the Administrative Law Judge's finding, and the Company's proposal, that MERC-PNG be allowed to require telemetry for transportation customers, without exception. The OES supported MERC-PNG's proposal.

Based on the discussion above, the OES believes that MERC-PNG made a reasonable attempt to estimate its design-day and peak-day sendout. However, given the lack of daily data associated with MERC-PNG's interruptible and transportation customers, the OES recommends that the Commission not endorse this technique until such time that MERC-PNG has adequate daily interruptible and transportation throughput data. Further, the OES recommends that MERC-PNG provide the following in its *Reply Comments*:

- a full discussion detailing how it intends to install telemetry on its transportation customers and an estimate of how long it will be before it has adequate daily data to estimate its firm design day more accurately;
- a full discussion explaining how it arrived at its interruptible and transportation customer usage estimates that it incorporates into its design-day analysis; and
- a full discussion of whether MERC-PNG is examining other techniques to improve its interruptible customer usage estimates.

B. VOLUME RISK ADJUSTMENT

In its initial *Petition*, MERC-PNG states that it adds a volume risk adjustment to its design day estimate. The volume risk adjustment's purpose, as stated by the Company, is "to provide a confidence level that the daily metered load under design conditions would not exceed the daily metered regression estimate." The confidence level MERC-PNG chose is 97.5 percent, which means that there is roughly a 2.5 percent chance that any given design day estimate will exceed the daily throughput estimate at a given point. In its response to discovery in the Viking PGA system demand entitlement filing, MERC-PNG states that a 99.9 percent confidence level could have also been chosen, which means that there would be a roughly 0.1 percent chance that a given design day estimate would exceed throughput estimates. Procuring demand contracts to meet a 99.9 percent confidence level would essentially assure full system integrity under any circumstance, but would also involve additional costs over MERC-PNG's current 97.5 percent confidence level. Given this trade-off between reasonable cost and absolute reliability, the OES recommends that MERC-PNG provide the following in its *Reply Comments*:

• a full discussion explaining why it chose the 97.5 percent confidence level that it uses in its design day analysis; and

-

⁵ Docket No. G011/M-09-1285.

Analyst assigned: Adam John Heinen

Page 5

• a full analysis, including supporting calculations, comparing demand costs at the 97.5 confidence level and at the 99.9 percent confidence level.

2. Demand Entitlement Level

In its *Petition*, MERC-PNG requests the addition of 1,000 Mcf/day to its FT8466 contract for the 2009-2010 heating season. This addition would result in total capacity for this contract of 1,500 Mcf/day.

Given mild temperatures during recent heating seasons, the OES investigated the historical peak-day sendout per customer. OES Attachment 4 shows that the all-time peak-day sendout per customer was 1.6222 Mcf/customer during the 1998-1999 heating season. The OES notes that peak-day sendout per customer was near to the all-time peak day sendout during the 2008-2009 heating season at 1.5913 Mcf/customer per day (OES Attachment 4).

As indicated in OES Attachment 5, MERC-PNG's proposed design-day requirement increased 1,000 Mcf/day (or approximately 9.52 percent) from 10,500 Mcf/day to 11,500 Mcf/day. This increase is less than the 14-year average change in the forecasted design-day number of customers of 5.11 percent, and the overall projected customer growth rate for the 2009-2010 heating season of 3.30 percent.

As indicated in OES Attachment 4, the firm peak-day sendout on its GLGT system for the 2008-2009 heating season was 9,779 Mcf/day, an increase of 4,714 Mcf/day (or approximately 93.11 percent) over the 2007-2008 heating season. As shown in OES Attachment 4, the peak-day sendout during the 2008-2009 heating season is the greatest firm throughput recorded on the Great Lakes system and represents a significant increase over the previous heating season. Given this information, the OES recommends that MERC-PNG provide, in its *Reply Comments*, a full discussion explaining the circumstances surrounding the peak-day sendout during the 2008-2009 heating season. The Company's proposed increase in design-day requirements results in an anticipated design-day use per customer of 1.7802 Mcf/day. The total entitlement per customer of 1.8952 Mcf/day is greater than the eight-year average peak-day sendout per peak-day customer of 1.3778 Mcf/day and the all-time peak day sendout per customer of 1.6222 Mcf/day.

Since MERC-PNG's design-day forecast estimates are greater than the all-time peak-day sendout, there does not appear to be a concern about reliability at this time, beyond resolution of the amounts used by interruptible and transportation customers, as noted above. However, it is also important to ensure that the Company does not over-estimate its need unreasonably and

⁶ When design-day forecasts of other Minnesota regulated natural gas companies were examined, the 1995-1996 and 1993-1994 heating seasons were generally where historic peak-day throughputs occurred. However, MERC-PNG has information available only from the 1998-1999 heating season going forward.

⁷ Please note that peak-day sendout per customer information is unavailable for the 2005-2006, 2006-2007, and 2007-2008 heating seasons.

Analyst assigned: Adam John Heinen

Page 6

cause PGA rates to be too high. The OES intends to continue working with the Company to refine the estimates of peak-day use per customer, and looks forward to reviewing the information MERC-PNG will provide in its *Reply Comments* related to its design-day calculations.

3. Reserve Margin

As shown in OES Attachment 4, the Company's entitlement proposal would result in a positive reserve margin for MERC-PNG's Great Lakes PGA system customers of 6.46 percent, which is a marked increase from the 2008-2009 reserve margin of 1.95 percent. This proposed increase in the reserve margin would bring the reserve margin over the five percent threshold that the OES considers to be an adequate reserve margin. However, given the design-day analysis issues discussed above, and the Great Lakes PGA system's lack of available storage and peak shaving, the OES believes that MERC-PNG's reserve margin is reasonable and adequate.

C. MERC-PNG'S SPECIFIC PROPOSED DEMAND ENTITLEMENT CHANGES

As MERC-PNG explains in its filing, there are two types of demand entitlement changes. The first type is design-day deliverability, which, in this filing, represents an increase of 1,000 Mcf/day of firm transportation capacity available to Great Lakes PGA customers during winter peak periods. The second type does not affect the design-day deliverability level, but does affect the demand costs recovered from ratepayers through the PGA. Changes in the second type of demand entitlement changes are made to non-winter transportation and balancing contracts and, in this filing, MERC-PNG does not propose any adjustments to these contracts types.

D. MERC-PNG'S GREAT LAKES PGA SYSTEM COST RECOVERY PROPOSAL

The demand entitlement changes proposed above represent the demand entitlements that firm customers on MERC-PNG's Great Lakes system would pay. The Company's *Petition* uses MERC-PNG's October 2009 PGA as a means of comparison for its entitlement level cost changes since MERC-PNG proposes that the rate change take effect on November 1, 2009. MERC-PNG's proposed changes would result in the following bill impacts:

Analyst assigned: Adam John Heinen

Page 7

Table 1: M	Table 1: MERC-PNG's Great Lakes PGA System Cost Recovery Monthly Rate Impact as													
	Calculated by MERC-PNG Compared to the October 2009 PGA													
Customer	Commodity	Commodity	Demand	Demand	Total	Total	Effect on Annual							
Class	Change	Change	Change	Change	Change	Change	Bill (\$)							
Class	(\$/Mcf)	(Percent)	(\$/Mcf)	(Percent)	(\$/Mcf)	(Percent)	Dill (\$)							
General	\$0.6994	19.07%	\$0.0481	6.04%	\$0.7475	12.27%	\$109.47							
Service	φ0.033 4	19.07%	\$0.0 4 61	0.04%	\$0.7473	12.2770	\$109.47							
Small Vol.	\$0.6994	19.07%	\$0.0000	0.00%	\$0.6994	14.24%	\$2,822.62							
Interruptible	\$0.0994	19.07%	\$0.0000	0.00%	\$0.0994	14.24%	\$2,022.02							
Small Vol.	\$0.6994	19.07%	\$0.0000	0.00%	\$0.6994	14.10%	\$3,820.26							
Firm	\$0.0994	19.07%	\$0.0000	0.00%	\$0.0994	14.10%	\$5,620.20							

As shown above, and in MERC-PNG Attachment 4 in its *Initial Petition*, the Company's proposed entitlement levels would result in the following estimated annual bill impacts:

- an increase of approximately \$109.47, or 12.27 percent, for an average General Service customer consuming 146 Mcf annually;
- an increase of approximately \$2,2822.62, or 14.24 percent, for an average Small Volume Interruptible customer consuming 4,036 Mcf annually; and
- an increase of approximately \$3,820.26, or 14.10 percent, for an average Small Volume Firm customer consuming 5,462 Mcf annually.

The OES's analysis is somewhat different from that shown in MERC-PNG's initial *Petition* for two reasons. First, the OES holds the weighted average cost of gas constant, to isolate the increases in total gas costs associated solely with the demand cost of gas. Second, while analyzing MERC-PNG's proposal, the OES observed that the Company incorrectly calculated the rate impact of Call Options in its cost recovery (OES Attachment 6). It appears that MERC-PNG inadvertently used firm sales, rather than total system sales, to calculate the per-unit cost. Total sales is the appropriate figure since all customers benefit from hedging. The OES recommends that MERC-PNG correct this error in its monthly PGA filing as soon as possible and refund any, and all, over-recoveries associated with this error in its September 1, 2010 true-up filing. The OES calculates bill impacts as follows:

⁸ MERC-PNG's spreadsheet refers to "total sales," so it appears that the Company inadvertently calculated the Call Option rate incorrectly. Moreover, the amount of this error is likely to be relatively small.

Analyst assigned: Adam John Heinen

Page 8

Table 2: M	Table 2: MERC-PNG's Great Lakes PGA System Cost Recovery Monthly Rate Impact as												
Calculated by the OES Compared to the October 2009 PGA													
Customer Class	Commodity	Commodity	Demand	Demand	Total	Total	Effect on						
	Change (\$/Mcf)	Change (Percent)	Change	Change	Change	Change	Annual						
			(\$/Mcf)	(Percent)	(\$/Mcf)	(Percent)	Bill (\$)						
General Service	\$0.0114	0.31%	\$0.0481	6.04%	\$0.0595	0.98%	\$8.69						
Small Vol. Interruptible	\$0.0114	0.31%	\$0.0000	0.00%	\$0.0114	0.23%	\$46.01						
Small Vol. Firm	\$0.0114	0.31%	\$0.0000	0.00%	\$0.0114	0.23%	\$62.27						

Note: The change in commodity cost relates to the implementation of Call Option costs for the 2009-2010 heating season. The rate changes associated with interruptible customers is the result of these changes in Call Option costs.

As shown in Table 2 above, and in OES Attachment 7, the OES proposed entitlement levels result in the following estimated annual bill impacts:

- an increase of approximately \$8.69, or 0.98 percent, for an average General Service customer consuming 146 Mcf annually;
- an increase of approximately \$46.01, or 0.23 percent, for an average Small Volume Interruptible customer consuming 4,036 Mcf annually; and
- an increase of approximately \$62.27, or 0.23 percent, for an average Small Volume Firm customer consuming 5,462 Mcf annually.

III. THE OES'S RECOMMENDATIONS

Based on its concerns associated with MERC-PNG's design-day calculations, the OES withholds recommendation in this proceeding until the Company provides additional information in its Reply Comments. Given these concerns, the OES recommends that MERC-PNG provide the following in its Reply Comments:

- a full discussion explaining why its heating degree day adjustment differs from the National Weather Service's calculation standard and what, if any, impact using the official wind chill calculation has on its design-day forecasts;
- a full discussion detailing how it intends to install telemetry on its transportation customers and an estimate of how long it will be before it has adequate daily data to more accurately estimate its firm design day;
- a full discussion explaining how the Company arrived at its interruptible and transportation customer usage estimates that it incorporates into its design-day analysis;
- a full discussion of whether MERC-PNG is examining other techniques to improve its interruptible customer usage estimates;

Analyst assigned: Adam John Heinen

Page 9

- a full discussion explaining why it chose the 97.5 percent confidence level that it uses in its design day analysis;
- a full analysis, including supporting calculations, comparing demand costs at the 97.5 confidence level and at the 99.9 percent confidence level in its volume risk adjustment; and
- a full discussion explaining the circumstances surrounding the peak day sendout during the 2008-2009 heating season.

The OES also recommends that MERC-PNG correct the calculation error in its monthly PGA filing related to its Call Option rates as soon as possible and refund any, and all, over-recoveries associated with this error in its September 1, 2010 true-up filing.

Request No.	
3	Subject: Design-Day Weather Data
	MERC-PNG Great Lakes uses adjusted heating degree days (AHDDs) as an input in its design-day study models. As discussed in the OES's June 17, 2009 Response Comments in Docket No. G011/M-08-1328, Commission Staff raised concerns about the appropriateness of using AHDDs in calculating the design-day. Given these concerns, please provide any, and all, evidence, including by not limited to statistical analysis, that fully supports MERC-PNG's use of AHDDs in its design-day calculations. If this information has already been provided in written testimony or in response to an earlier OES information request, please identify the specific testimony cite(s) or OES information request number(s).
	Response: The Excel file attachment in the response to Information Request 2(a) shows the details of the regressions run using MERC-PNG Great Lakes adjusted heating degree days (AHDD) on the "3yr-AHDD65" tab. The "3yr-HDD65" tab contains the regression results using standard heating degree days (HDD). The standard error, or sigma, for the AHDD regression of 572.86 is 7% lower than the HDD regression sigma of 615.74, indicating that the AHDD variable provides a better fit than HDD. The AHDD regression also has a higher R-Squared value than the HDD regression (0.888 vs. 0.871). The attached Excel file "MERC09-1283-IR3-

MERCpeakDayAHDD65vsHDD65sigmas20090930.xls" summarizes the same comparison for each MERC peak day forecast region, and shows that AHDD65 provides a better fit for all eight MERC regression areas, regardless of which goodness of fit measure is used.

Note: The above analysis is focused on directly comparing AHDD verses HDD to determine which variable better matches MERC customer demand. The final Design Day forecast "3yr-S+AHDD65" regression uses AHDD with additional significant variables.

Per Peoples, the 2001-02 Design Day declined due to a downward trend in consumption and heat factor possibly due to high gas costs in 2000-01 and more energy efficient housing.

 ^{# –} The analysis conducted by the OES does not include the 423 Mcf/day capacity related to MERC's FT0011 agreement.
 This decision to omit these volumes is discussed in the body of the Comments in Docket No. G011/M-07-1404.
 *Per Peoples, information prior to 1995 is not available.
 **Corrected from peak day to design day number of customers.

^{***} The Company has not provided the number of peak-day oustomers beginning from the 2005-2006 heating season.

A The number of peak day customers is calculated using the Residential and Commercial customer count data provided in MERC's Attachment 11.

Note: Ifalicized Lines above indicate a contract that has changed since the October PGA filing.

Note: The OES holds the Commodity Cost of Gas constant to isolate the effect of demand changes on rates. However, there is a slight change in commodity costs above, which is the result of call option premiums.
