Re: 2021 ANNUAL REPORT
PERFORMANCE METRICS AND INCENTIVES
DOCKET NO. E002/CI-17-401

Dear Mr. Seuffert:

Northern States Power Company, doing business as Xcel Energy, submits the enclosed Performance Metrics Annual Report for the period of January 1, 2021 to December 31, 2021 pursuant to the Minnesota Public Utilities Commission's April 16, 2020 ORDER ESTABLISHING METHODOLOGIES AND REPORTING SCHEDULES in the above-noted docket.

We have electronically filed this document with the Commission, and copies have been served on the parties on the attached service list. Please contact Bridget Dockter at bridget.dockter@xcelenergy.com or (612) 337-2096 or Mary Martinka at mary.a.martinka@xcelenergy.com or (612) 330-6737 if there are any questions regarding this submission.

Sincerely,

/s/

ALLEN D. KRUG
ASSOCIATE VICE PRESIDENT, STATE REGULATORY POLICY

IN THE MATTER OF THE COMMISSION
INVESTIGATION TO IDENTIFY AND
DEVELOP PERFORMANCE METRICS AND
POTENTIALLY, INCENTIVES FOR XCEL
ENERGY'S ELECTRIC UTILITY OPERATIONS

DOCKET NO. E002/CI-17-401

ANNUAL REPORT

INTRODUCTION

Northern States Power Company, doing business as Xcel Energy, submits this Performance Metrics Annual Report (Report) for the period of January 1, 2021 to December 31, 2021 pursuant to the Minnesota Public Utilities Commission's April 16, 2020 ORDER ESTABLISHING METHODOLOGIES AND REPORTING SCHEDULES in the above-referenced docket. This Report includes an evaluation of results on the 33 Commission-approved metrics tracked for calendar year 2021, provides updates on new metrics that we are continuing to develop, and reports on required stakeholder engagement. Additionally, the Commission's decision in our Integrated Resource Plan docket will create a new docket dedicated to the workforce transition.¹ To reduce redundancy of significant reporting overlap, we ask the Commission to move the reporting of the Workforce Transition Plan from this annual report to the forthcoming workforce transition docket.

Xcel Energy is the first and only Minnesota utility operating under a multiyear rate plan pursuant to Minn. Stat. § 216B.16, subd. 19, which authorizes, in part, the Commission to require a "utility to provide a set of reasonable performance measures and incentives that are quantifiable, verifiable, and consistent with state energy policies." Pursuant to this authorization, the Commission initiated the present proceeding to gain a better understanding of how performance metrics and standards, and potentially incentives, in addition to those already in Xcel Energy's Quality Service Tariff,² could further align the Company's strategic priorities with the public interest.

¹ See Docket No. E002/RP-19-368, ORDER APPROVING PLAN WITH MODIFICATIONS AND ESTABLISHING REQUIREMENTS FOR FUTURE FILINGS at 39 (April 15, 2022).

² Xcel Energy Minnesota Electric Rate Book – MPUC No. 2, Section 6, Sheets 7.1 to 7.11.

During a robust and engaging stakeholder process, participating stakeholders considered calculations, verification, reporting, process schedules and progress updates, and agreed to revisit and re-assess any approved metrics later in the proceeding as needed. The Commission ultimately adopted 33 metrics related to customer focus, utility performance and public policy.³

The Commission's February 9, 2022, Order in the present docket approved our 2020 first annual report with additional reporting requirements. The additional requirements are addressed in this Report and include:

1. Provide three years contextual data, where applicable or an established industry standard or state policy goal.
2. Display low-income energy efficiency program participation on a map overlaid with Areas of Concentrated Poverty in our future annual service quality reports.
3. Display low-income energy bill pay assistance program participation on a map overlaid with Areas of Concentrated Poverty in our future annual service quality reports.
4. Provide three years of data before developing evaluation and benchmarking targets for the performance metrics.
5. Include information on the availability of data specific to our gas suppliers on upstream methane emissions; regulation of methane emissions upstream of the Company's distribution system, and the Company's position on such regulations; participation in voluntary initiatives to quantify and reduce methane from gas suppliers; any certified gas purchases; pilots with gas marketers to track and source gas with lower associated methane emissions; and any other actions the Company has taken to secure data on and/or reduce upstream methane emissions. No later than 2024, the Company will re-evaluate data available on upstream methane to consider feasibility of reporting of methane emissions attributable to total natural gas purchases across the full fuel cycle (from drilling and extraction to the end-use).
6. Once the Commission has determined adequate data on upstream methane is available to support utility-specific reporting of such emissions, we must include in the annual report, methane emissions across the full fuel cycle in its calculation of greenhouse gas emissions avoided by electrification of buildings, agriculture, and other sectors.
7. Host one or more stakeholder meetings to ask questions and provide feedback on the proposed scorecard.
8. Obtain additional stakeholder feedback on the Workforce Transition metric as it is developed for the 2021 annual performance metrics report.

³ *In the Matter of a Commission Investigation to Identify Performance Metrics, and Potentially, Incentives for Xcel Energy's Electric Utility Operation*, Docket No. E002/CI-17-401, ORDER ESTABLISHING PERFORMANCE METRICS at 12-14 (September 18, 2019).

We are pleased to provide this assessment of the Company’s performance metrics tracking for 2021. This Report is organized as follows:

- Section I lists the Commission-approved metrics and reporting requirements;
- Section II discusses specific April 16, 2020 and February 9, 2022 Order points that require additional explanation beyond the information included in our spreadsheet;
- Section III summarizes stakeholder discussions and associated filing requirements.

2021 PERFORMANCE METRICS

I. ESTABLISHED OUTCOMES AND METRICS

Table 1 below lists the 33 metrics approved by the Commission on April 16, 2020, by Outcome, provides reference to the corresponding line in Attachment A, and notes any attachments specific to that metric. Most metrics are reported in Attachment A, unless they required additional discussion.

A. Approved Metrics

**Table 1
Commission-Approved Metrics by Outcome**

#	Outcome / Metric Description	Corresponding Row in Attachment A	Reporting Status	Associated Report Attachment
Affordability				
1	Rates per kWh based on total revenue, reported: (1) by customer class and (2) with all classes aggregated	1	Began 2020 PBR Report	n/a
2	Average monthly bills for residential customers	2	Began 2020 PBR Report	n/a
3	Total disconnections for nonpayment for residential customers	3	Current	n/a
4	Total arrearages for residential customers	4	Current	n/a
Reliability				
5	System Average Interruption Duration Index (SAIDI)	1	Current	n/a
6	System Average Interruption Frequency Index (SAIFI)	2	Current	n/a
7	Customer Average Interruption Duration Index (CAIDI)	3	Current	n/a
8	Customers Experiencing Long Interruption Duration (CELID)	4	Current	n/a
9	Customers Experiencing Multiple Interruptions (CEMI)	5	Current	n/a
10	Average Service Availability Index (ASAI)	6	Current	n/a

#	Outcome / Metric Description	Corresponding Row in Attachment A	Reporting Status	Associated Report Attachment
11	Momentary Average Interruption Frequency Index (MAIFI)	7	Current, but not with AMI technology. Report in 2026	n/a
12	Power Quality	8	New Report in 2026	n/a
Customer Service Quality				
13	Existing multi-sector metrics, including ACSI and J.D. Power (MN)	1	Began in 2020 PBR Report	B
14	Call center response time	2	Current	n/a
15	Billing invoice accuracy	3	Current	n/a
16	Number of customer complaints	4	Current	n/a
Environmental Performance				
17	Total carbon emissions by: (1) utility-owned facilities and PPAs and (2) all sources	1	Began in 2020 PBR Report	n/a
18	Carbon intensity (emissions per MWh) by: (1) utility-owned facilities and PPAs and (2) all sources	2	Began in 2020 PBR Report	n/a
19	Total criteria pollutant emissions	3	Began in 2020 PBR Report	n/a
20	Criteria pollutant emission intensity (criteria pollutant emissions per MWh)	4	Began in 2020 PBR Report	n/a
21	CO2 emissions avoided by electrification of transportation – Alternative & Original approach <ul style="list-style-type: none"> a. Percent of Electric vehicles in Xcel Energy’s Minnesota service territory participating in managed charging programs or on whole house rates b. Percent of managed charging customers residential electric vehicle charging load occurring during off-peak hours c. CO2 avoidance calculated from electric vehicle charging 	5(a) 5(b) 5(c)	Began in 2020 PBR Report	n/a
22	CO2 emissions avoided by electrification of buildings, agriculture, and other sectors	6	Began in 2020 PBR Report	n/a
23	Discussion of fugitive emissions of methane, including proposed methodology for reporting fugitive emissions for methane	7	Began in 2020 PBR Report	n/a

#	Outcome / Metric Description	Corresponding Row in Attachment A	Reporting Status	Associated Report Attachment
24	Availability of data specific to its gas suppliers on upstream methane emissions; regulation of methane emissions upstream of the Company's distribution system, and the Company's position on such regulations; participation in voluntary initiatives to quantify and reduce methane from gas suppliers; any certified gas purchases; pilots with gas marketers to track and source gas with lower associated methane emissions; and any other actions the Company has taken to secure data on and/or reduce upstream methane emissions. No later than 2024, the Company will re-evaluate data available on upstream methane to consider feasibility of reporting of methane emissions attributable to total natural gas purchases across the full fuel cycle (from drilling and extraction to the end-use).	8	New	C
25	Methane emissions across the full fuel cycle in its calculation of greenhouse gas emissions avoided by electrification of buildings, agriculture, and other sectors.	9	We do not report yet.	n/a
Cost Effective Alignment of Generation and Load				
26	Demand response, including (1) capacity available (MWh) and (2) amount called (MW, MWh per year)	1	Current	n/a
27	Amount of demand response that SHAPES customer load profiles through price response, time varying rates, or behavior campaigns.	2	New/TBD	n/a
28	Amount of demand response that SHIFTS energy consumptions from times of high demand to times when there is a surplus of renewable generation.	3	New/TBD	n/a
29	Amount of demand response that SHEDS loads that can be curtailed to provide peak capacity and supports the system in contingency events: a. For available load b. For actual load reduction c. Metrics that measure the effectiveness and success of (a & b) individually and in aggregate	4(a) 4(b) 4(c)	Began in 2020 PBR Report	n/a
Workforce and Community Development				
30	Workforce Transition Plan	1	New	E
Other Stakeholder Discussions				
31	Public Dashboard	1	New/TBD	D
32	Demand Response Performance Incentive	2	New/TBD	n/a
33	Evaluation Criteria and Benchmarks	3	New/TBD	n/a

B. Future Metrics

The Reliability Outcome metrics of MAIFI_E and Power Quality are both considered future metrics, as they are tied to the successful deployment of our proposed Advanced Meter Infrastructure (AMI). We currently anticipate AMI deployment will be complete in 2025. As a result, tracking will begin in 2026 and reporting will begin in 2027.

It should be noted that while the Company does currently report on MAIFI_E, until AMI is fully deployed, the MAIFI_E numbers will continue to reflect only the momentary data as reported via Supervisory Control and Data Acquisition (SCADA) systems.

II. RESPONSE TO COMMISSION ORDER POINTS

The nature of the metrics and their calculations approved in the Commission's Order require both a final calculation as well as a more holistic explanation for certain metrics; this section provides that explanation. For easy cross-reference, those metrics where we provide additional narrative below are noted in the metrics list, Attachment A.

A. Low Income Mapping Added to Service Quality Annual Reporting

In its February 9, 2022, Order in this docket, the Commission approved the creation of an additional map into our future annual service quality report filings. This map will display both low-income energy efficiency program participation as well as low income bill-pay assistance program participation with an overlay of Areas of Concentrated Poverty in our future annual service quality reports, beginning April 1, 2022 in Docket No. E002/M-22-162. These two maps will be added to the previously ordered equity-based map illustrating CEMI-6, CELI-12, and Customer Disconnections, developed by the workgroup through a consensus process.

B. Customer Service Quality

1. J.D. Power

The J.D. Power calculation of overall satisfaction score is a weighted index based on customer scores across 41 different attributes that fall into six broad categories:

- (1) power quality & reliability;
- (2) billing and payment;
- (3) corporate citizenship;
- (4) communications;
- (5) price; and
- (6) customer service.

The weighting for each category ranges from 9% to 25%, totaling 100%. The 41 attributes provide additional opportunities to improve satisfaction beyond the six categories. Examples of the 41 attributes include: customer communications during an outage; ease of understanding and fairness of pricing; ease and variety of options to pay bills; taking action to care for the environment; helping customers understand how to reduce energy use; communicating safety around electricity; and ease of using our call

center and website for customer service. J.D. Power data scientists use proprietary regression modeling to refine this weighting annually to maintain a current picture of what drives customer satisfaction with utilities.

J.D. Power publishes utility satisfaction scores by region for residential customers each year in December (starting 2020) at the end of its annual study and makes the scores available to the public. J.D. Power combines customer scores for Xcel Energy customers in Minnesota, North Dakota, South Dakota, Wisconsin, and Michigan and publishes the score in *Xcel Energy Midwest*. J.D. Power does not report scores publicly at a more granular level.

Xcel Energy confirmed with J.D. Power that Xcel Energy's scores for the state of Minnesota could be shared annually with the Commission and used in a public facing online dashboard.

Table 2 below sets forth the Minnesota residential overall satisfaction rankings for 2021, and, for reference, 2017 through 2020. Table 2 also includes the scores of the top six categories surveyed by J.D. Power. Our peer set, as defined by J.D. Power, includes 55 investor-owned utilities (IOUs) who also participate in the survey. As shown below, Xcel Energy MN ranked at 51% for overall customer satisfaction in 2021, which is lower than the previous four years. The primary reasons for the decrease are negative perceptions about price, which may be a combination of price and past-due bills from the pandemic. There also remains a portion of our customer base still impacted by the ongoing pandemic. Another noticeable contributor to the decline is lowered awareness of the Company's community efforts, including volunteering, donations and environmental initiatives. These types of awareness reductions are known to correlate with declining scores. Last, when it comes to rankings, there can be tight clustering of scores among the utilities for some of the main categories, which can dramatically affect the utility rank without a corresponding statistically significant scoring. In 2021, this was witnessed for Billing & Payment, where Xcel Energy MN dipped 26% in rank compared to 2020 despite only having a statistically insignificant scoring decline of 9 points. This means that many of the utilities in this ranking set are performing at relative parity, though looking just at rank alone in this instance will not be able to reflect this.

In 2021, Xcel Energy formulated priority action plans around addressing customers citing financial hardship or difficulties paying their bills. One major initiative included implementing front and center messaging on Xcel Energy's website <https://www.xcelenergy.com/MyAccount> that orients customers to various financial assistance resources offered or collaborated on by the Company. In addition, targeted e-mail campaigns and ads via Facebook were delivered to customers with a past-due balance. As a result, our contact centers observed an increase in the number of customers enrolling in flexible payment arrangements. Last, credit/collection activity

by the Company was intentionally minimal when compared to historical (pre-pandemic) norms. The disconnection moratorium decreased the level of communication we have with our customers, particularly during a time when we would typically be working with our customers to help them through challenges the pandemic caused, such as connecting them with energy assistance to help pay their utility bill. Generally, we found it difficult to get customers to respond to us, because they knew they would not be disconnected. Given the many challenges raised by the pandemic, our customers had other priorities on their minds. As a result, many saw their utility bill grow, and as we began to resume some credit and collection activities, perceptions about high bills and paying them resurfaced with customers.

In 2022, and in response to the decline in our J.D. Power scores, a J.D. Power Remediation/Action Planning team has been formed to investigate and address the six key categories of J.D. Power to ensure all facets of customer satisfaction are being addressed. Preliminary efforts to address these scores include strategic communications, advertising and proactive messaging to explain and improve price perceptions and increasing awareness of Xcel Energy's corporate citizenship efforts. As the Remediation/Action Planning team evaluates the scores in each category, the Company plans to continue its efforts to address these issues.

Finally, the Company is actively pursuing a number of rate mitigation tools that we plan to review with stakeholders. For example, the recent Midcontinent Independent System Operator (MISO) capacity auction has resulted in a significant increase in expected revenues from generation capacity sales. We plan to work with stakeholders to ensure that these revenues contribute to reductions to our requested rate increases in our instant rate proceeding. We will also be interested in discussing additional rate mitigation tools that can be applied to further mitigate rate impacts, including but not limited to the potential for lower depreciation rates for some wind facilities, similar benefits from extending the life of the Monticello nuclear facility and accelerated flowback of certain tax benefits (ADIT) to customers. We believe there is significant potential for rate relief and ultimately, improvement in customer satisfaction as we transition out of the pandemic.

Table 2
Minnesota Residential Overall Satisfaction Scores for 2017-2021

Xcel Energy - MN Residential OSAT Index + Major Factors	2021 Peer Set Percentile Rank	2020 Peer Set Percentile Rank	2019 Peer Set Percentile Rank	2018 Peer Set Percentile Rank	2017 Peer Set Percentile Rank
OSAT *	51%	69%	89%	78%	65%
Power Quality & Reliability	69%	83%	89%	80%	67%
Price	50%	61%	85%	84%	65%
Billing & Payment	20%	46%	65%	56%	44%
Corporate Citizenship	69%	89%	87%	85%	71%
Communications	46%	61%	85%	85%	51%
Customer Care	65%	56%	91%	87%	60%

* OSAT is Overall Satisfaction

2. ACSI

The American Customer Satisfaction Index (ACSI) provides benchmarks by company for the largest investor-owned energy utilities serving residential customers. J.D. Power has 173 large/midsize utilities in its benchmark, while ACSI has 26 IOUs. However, during the Commission hearing in this proceeding, we agreed to provide the public facing survey results that can be found on the ACSI website⁴ free of charge for Commission review. We include as Attachment B to this report ACSI's most recent overall satisfaction survey scores for IOUs.

C. Call Center Response Times

Throughout 2021, the Company continued to respond to the impacts of COVID-19 and market pressures as we struggled to attract and retain our call center workforce. Between January 2021 and the date of this filing, our call center hired 347 agents and lost 228 agents, an unprecedented 66 percent attrition rate. At the end of 2021, our call center staffing was over 90 percent of actual need. We have engaged in aggressive hiring efforts to bring the call centers up to needed staffing levels. As of the date of this filing, we have made progress on our hiring efforts, and our call center is currently staffed at 99 percent. We now know the hiring and retention issues affected companies across all industries and is not limited to Xcel Energy alone.

⁴ <https://www.theacsi.org/industries/energy-utilities>.

Our call center workforce challenges impacted our call center performance for several reasons. First, like many other companies, worker illness due to COVID impacted our call response time. Specifically, absenteeism increased significantly over the past 12 months. In 2021, over 50 percent of all employees in our Customer Care organization, which includes our call center employees, were absent at least once due to COVID-related illness.

Second, as mentioned above, we hired 347 new agents. These new agents are required to attend a six-week training program and then attend a two-week on-the-job training. We have found that newly-hired call center employees tend to have longer call handle times as they work toward becoming proficient in their roles. After four months, new agents have been taught the skills to navigate their job, but agents are not considered proficient until they have been working 9 to 12 months. The longer call handle time of new agents is reflected in 2021 and, due to the number of new hires, we expect our 2022 call response times may be longer than normal. In addition, our call centers, like call centers in other industries, experience significant turnover, which means that we have a large portion of agents in training or newly graduated from the training program, which impacts our average call handle time and overall call center metrics.

Finally, as an organization, we moved to virtual work locations in 2020 and throughout 2021 to mitigate employee health risks throughout the Company. This move posed some technological challenges and also decreased the opportunity for individual contact between employees making training somewhat more challenging. As a Company, we have increased supplemental training sessions in 2022 to further improve employee performance.

In October of 2021, we responded to these challenges by increasing our starting wage by nearly 20 percent, to \$17.00/per hour. This increase resulted in relatively immediate improvements in our ability to attract new staff and retain current experienced staff. The Company also continues its efforts to attract employees in non-traditional communities. In addition, we intend to maintain a flexible virtual workforce strategy moving forward which we hope will serve as an attractive option to potential candidates.

Another reason for increased call response time in 2021 was due to the colder-than-normal temperatures in some of our jurisdictions, which results in higher heating costs for our customers. Customer calls about higher bills generally take more time to address and resolve.

D. Demand Response Metrics

In its April 16, 2020 Order, the Commission approved additional metrics for demand response including MWh and amount called for load shedding, shaping and shifting. Additionally, a wording adjustment for our final metric of load factor for load net of variable generation was approved, setting the baseline for this future metric. We have included demand response capacity details for shedding load in Attachment A and address future metrics below.

1. Amount of Demand Response that Shapes Load

Demand response activities for shaping customer load include specific customer rates such as time-of-use (TOU) and behavioral demand response. The Company's Residential TOU Pilot, Flex Pricing, launched in November of 2020. See Docket No. E002/M-17-775. The pilot will run for two years and is designed to study customer responses to price signals, targeted communications, and enhanced data access. Customer communications include regular emails and outreach via community partners. The community engagement efforts are largely multilingual, using community channels to ensure the Company reaches non-English-speaking participants. The Company has also filed a pilot for commercial rates, including Critical Peak Pricing and TOU, in Docket No. E002/M-20-86. Once data has been compiled for complete pilots, we will include results attributed to demand response future reports.

2. Amount of Demand Response that Shifts Load

Activities for shifting load include such technologies as electric vehicle optimization or commercial thermal storage. On February 1, 2021 the Company petitioned the Commission for approval of four pilots in our Load Flexibility Petition (Docket No. E002/M-21-101). These pilots are intended to provide customer incentives for reducing peak demand and shifting usage to off-peak periods as a cost-effective way to utilize current system resources. On January 6, 2022 the Commission approved three of these pilots, with some modifications. We intend to launch these programs in the summer of 2022. Pilot results will be included as part of future reporting when utilized for shifting load rather than a reduction during the peak (which are shedding resources).

3. Load Factor for Load Net of Variable Renewable Generation

The "load factor for load net of variable renewable generation" metric was chosen as an appropriate metric as it is based on data of hourly generation by generation source that is currently tracked by the utility, and directly addresses the performance of aligning load through demand response to renewable generation sources. The metric reported for 2021 – 41.20 % – is the annual load factor for load on the Company's generation system

when load provided by renewable generation sources is excluded. This load factor includes the load from hydro generation, which is not considered renewable generation for this metric. This metric will allow us to incorporate the results of the previous demand response metrics as they continue to evolve; however, this metric also accounts for further impacts such as energy efficiency, which is measured through our Conservation Improvement Program (CIP).

E. Environmental Performance

The Environmental Performance Outcome hosts nine metrics and three sub-metrics. Where 2021 results needed no additional explanation, the metrics are noted to “See Attachment A for 2021 results.” Where additional explanation is necessary, it is provided below with the associated metric.

1. Total carbon emissions by (1) utility-owned facilities and PPAs and (2) all sources [See Attachment A for 2021 results]
2. Carbon intensity (emissions per MWh) by (1) utility-owned facilities and PPAs and (2) all sources [See Attachment A for 2021 results]
3. Total criteria pollutant emissions

We report criteria pollutant information for utility-owned facilities only. As explained in our October 31, 2019 *Proposed Metric Methodology and Process Schedule on Performance Metrics and Incentives* report, approximately 85% of criteria pollutant emissions associated with the electricity we provide to our customers are from units that Xcel Energy owns, meaning we have high confidence in the quality of the data, because we have CEMS data, stack test data, and fuel consumption data for these sources. The remaining 15% of criteria pollutant emissions are from sources we do not own, associated with energy purchased either through PPAs or in the wholesale market. The quality of the emissions data for these sources is less certain; we may have some directly measured data from certain sources, but for the others, we may have little insight into the generating source and the accompanying emissions.

In 2021, total criteria pollutant emissions from utility-owned facilities were:

- NO_x: 7,318 tons
- SO₂: 3,886 tons
- PM: 541 tons
- Mercury: 0.0378 tons
- Lead: 0.0563 tons

4. Criteria pollutant emission intensity (criteria pollutant emissions per MWh)

For this metric – which as above is for utility-owned facilities only – total tons of criteria pollutant emissions are divided by total generation from owned facilities. [See Attachment A]

5. CO₂ emissions avoided by electrification of transportation – Alternative & Original approach

In this metric, we report three sub-metrics as requested by the Commission – two that focus on encouraging charging behavior that will tend to use lower-carbon electricity, and one that estimates CO₂ avoidance.

- a. Percent of EVs in Xcel Energy's MN service territory participating in managed charging programs or on whole-house TOU rates

For this metric, the Company proposed the following formula in our October 31, 2019 *Proposed Metric Methodology and Process Schedule on Performance Metrics and Incentives* report:

$$\frac{\text{Customers on EV-specific managed charging rates or whole-house TOU rates who have self-identified as EV owners}}{\text{Number of EVs registered in Xcel Energy's service territory}}$$

In 2021, the percent of EVs participating in managed charging programs or on whole-house TOU rates was 7%. This may be an underestimate, as it does not include customers on whole-house TOU rates who have self-identified as EV owners, for which we do not currently have data. It also does not account for the fact that a small number of those customers may own more than one EV but would only be counted once in the numerator.

- b. Percent of managed charging customers' residential EV charging load occurring during off-peak hours

For this metric, the Company proposed the following formula in our October 31, 2019 *Proposed Metric Methodology and Process Schedule on Performance Metrics and Incentives* report:

$$\frac{\text{Total annual energy consumed (MWh) by EVs charging during off-peak hours at the residences of customers enrolled in Xcel Energy's EV TOU rates or other managed charging programs}}{\text{Total annual energy consumed (MWh) by EVs charging at residences of customers enrolled in Xcel Energy's EV TOU rates or other managed charging programs}}$$

In 2021, the percent of managed charging customers' residential EV charging load occurring during off-peak hours was 94%.

c. CO₂ avoidance estimate calculated from electric vehicle charging

In our May 6, 2019 *Comments* and December 12, 2019 *Reply Comments* in this docket, the Company proposed a method to estimate CO₂ avoidance based on the estimated number of kWh provided for electric vehicle (EV) charging, the estimated electric driving miles thus enabled, and the estimated amount of CO₂ that would have been emitted had that same number of miles been driven on gasoline. The method was further refined in our 2020 Annual Report, and we do not propose any new adjustments in this Annual Report. The method includes:

- A focus on light-duty EVs, which constitute the vast majority of EVs in our service territory.
- Calculation of the total annual kWh consumption by EVs by multiplying the number of EVs in the Company's Minnesota service territory at year end 2021 (20,441 EVs, including PHEVs and BEVs) by an estimate of the typical annual consumption per light-duty EV which is updated each year to reflect current data (4,227 kWh for 2021, an average for both PHEVs and BEVs).
- Calculation of CO₂ emissions from EV charging by multiplying the total annual kWh consumption by the system average CO₂ rate per kWh for the year in question, as reported to The Climate Registry and third-party verified.⁵ For EV customers who are also renewable energy tariff subscribers (61 as of December 2021), instead of the system average rate we assume those customers subscribe to Windsource for their full consumption, and assign a CO₂ rate of 0 lbs/kWh to their EV charging.
- Calculation of CO₂ that would have otherwise been emitted by gasoline vehicles for an equivalent number of miles traveled by EVs. We use a conservative estimate of average kWh/mile which is updated annually (0.364 kWh/mile for 2021, based on data for light-duty EVs from www.fueleconomy.gov and

⁵ As in prior years, we acknowledge there are a variety of different possible electricity CO₂ emission factors that could be used, including MISO-wide and utility-specific emission factors, and marginal, hourly average, and annual average emission factors. We continue to use utility-specific annual average here for three reasons. First, it is important to keep the calculation methods consistent across years so that change in this metric (or any metric) reflects actual performance – e.g., lower-carbon electricity year over year – rather than simply a change in methods. Second, utility-specific emission factors are consistent with the Commission's design principle for this docket that "Metrics should seek to measure behaviors that are within a utility's control and free from exogenous influences, such as weather or market forces," while MISO emission factors would not meet this design principle. Third, annual average emission factors are reasonable considering that for this calculation we make no assumptions about the time of day of EV charging, in part because the majority of EV charging is not separately metered at this time. Using marginal or hourly emission factors would require metered data and/or assumptions about the time of day of EV charging.

incorporating a 10% charging inefficiency factor) to estimate the number of miles driven on electricity provided by the Company. We then calculate tailpipe CO₂ that would have been emitted if this same number of miles had been driven on gasoline, using a gasoline emission factor from EPA (404 grams of CO₂ per mile).

- The CO₂ avoidance metric is then calculated as the difference between emissions from annual EV use and displaced emissions that otherwise would have occurred from equivalent travel by gasoline vehicles. In the case of EVs charged on an all-renewable tariff, with RECs retired on the subscriber's behalf, there is no deduction for CO₂ from EV charging.

Based on these assumptions, we estimate the Company provided approximately 86 million kWh for EV charging in 2021, which enabled an estimated 237 million electric miles.⁶ Had those miles been driven on gasoline, about 105,711 short tons of CO₂ would have been emitted.⁷ EV charging was responsible for an estimated 28,816 short tons of CO₂.⁸ The difference between the two, 76,895 short tons, represents a reasonable estimate of CO₂ avoidance in 2021 from electrification of transportation.

In addition to the values reported for 2021 within in this annual report, we provide CO₂ avoided for years 2017-2020 in Attachment A. Following the Commission's approval of our 2021 annual report, we added 2017 and as a result identified updates to the values for 2018 and 2019 previously reported in 2020 to better reflect data for annual kWh consumption per EV and average kWh per mile for light duty EV for those years specifically. As described above, these values are refreshed annually.

6. CO₂ emissions avoided by electrification of buildings, agriculture, and other sectors

In our October 31, 2019 *Proposed Metric Methodology and Process Schedule on Performance Metrics and Incentives*, we recommended estimating CO₂ emissions avoided by electrification of buildings based on a comparison of CO₂ emitted to provide the same service (water heating, space heating, etc.) with electricity compared to a fossil fuel. Specifically, we proposed the basic formula:

⁶ 20,441 EVs * 4,227 kWh annual consumption per EV = 86,404,107 kWh estimated total EV charging.
86,404,107 kWh ÷ 0.364 kWh/mile = 237,373,920 electric miles enabled.

⁷ EPA estimates tailpipe emissions of about 404 grams CO₂ per mile for an average gasoline-powered passenger vehicle. See [Greenhouse Gas Emissions from a Typical Passenger Vehicle | Green Vehicle Guide | US EPA](#).

⁸ Assigning the Company's 2021 Upper Midwest CO₂ intensity of 0.669 lbs/kWh to the estimated 20,380 EVs not charged on a renewable tariff, and 0 lbs/kWh to the 61 EVs enrolled in Windsorce as of December 2021.

$$\frac{\text{(Annual average CO}_2\text{ emissions from the fossil electric appliances)} - \text{(energy (in kWh) consumed by the electric appliance)} *}{\text{(Xcel Energy's annual system average CO}_2\text{ rate per kWh)}}$$

The Company has negligible building electrification to report for 2021; however, statutory changes enacted in 2021 will enable more electrification going forward. First, the Energy Conservation and Optimization (ECO) Act, among other changes to the Conservation Improvement Program (CIP), allows “efficient fuel-switching” to be eligible for limited CIP spending. One type of efficient fuel-switching is a switch from natural gas or other fossil fuels to electricity for building heating, provided specified criteria are met. Implementation of ECO is currently underway, including Department of Commerce guidance for efficient fuel-switching released on March 15, 2022 in Docket No. E,G999/CIP-21-837.

Additionally, the Company supported passage of the Natural Gas Innovation Act (NGIA) in 2021, and is actively engaged in a Minnesota Public Utilities Commission docket to establish lifecycle GHG accounting and cost/benefit analysis frameworks for NGIA, for Commission adoption by June 2022.⁹ NGIA allows natural gas utilities to file five-year Innovation Plans including a range of different “innovative resources,” including strategic electrification, which NGIA defines as the installation of electric end-use equipment in existing or new buildings, provided natural gas remains a back-up fuel and certain criteria are met.

Both statutes will enable electrification of buildings, agriculture and other sectors, but since the related guidance and frameworks are yet to be finalized (by the Department of Commerce for ECO; by the Commission for NGIA), we do not yet have building electrification to report for 2021. Once those enabling regulations are adopted, the Company hopes to file our first NGIA innovation plan in late 2022, and our next CIP triennial plan in 2023, both of which may include building electrification if the finalized regulations are favorable to it.

We note that part of the process for both ECO and NGIA is the development and adoption of guidance/frameworks for lifecycle GHG accounting. These are still being refined, and it is not yet clear exactly what approaches will be adopted. Calculation methods for the environmental performance metric “CO₂ emissions avoided by electrification of buildings, agriculture, and other sectors” may be adjusted to align with the GHG accounting approaches ultimately adopted for efficient fuel-switching in ECO and strategic electrification in NGIA.

⁹ Docket No. G999/CI-21-566.

7. Fugitive Emissions of Methane

Xcel Energy is committed to reducing methane emissions throughout the natural gas supply chain, which includes actions we have taken on the portion of that supply chain that we control (the natural gas distribution system), as well as efforts to influence our natural gas suppliers to reduce methane emissions on the upstream and midstream portions (production, gathering and boosting, processing, transmission and storage of natural gas before it reaches our distribution system), which are discussed in the subsequent section for environmental performance metric 8.

a. Reducing methane emissions from our system

On the distribution system we own and control, methane emissions are already minimal. We have a long history of implementing operational improvements that reduce methane emissions, including system upgrades and participation in EPA's Natural Gas STAR and Methane Challenge programs. We have significantly reduced emissions from our distribution system primarily through replacing cast iron and unprotected steel pipes with protected steel and plastic. We have replaced all known cast iron distribution mains in Minnesota. At the end of 2021, 88% of our distribution mains and 96% of our distribution services were plastic, and another 10% of our distribution mains and 1.7% of our services were protected steel. A recent study¹⁰ shows pipe replacement can reduce distribution system emission rates well below the national average. Moreover, the recently released Natural Gas Sustainability Initiative (NGSI) *Methane Emissions Intensity Protocol* estimates that, compared to cast iron distribution mains with a GHG emission factor of 1,157 kg/mile, protected steel distribution mains have an emission factor of 97 kg/mile and plastic distribution mains 29 kg/mile,¹¹ showing that converting to plastic and protected steel can dramatically reduce methane emissions. In addition to pipe replacement, we have also worked to avoid natural gas releases during system construction work, increased leak survey frequency, and replaced existing high-bleed controllers with low or no-bleed controllers where possible.

We report methane emissions from the distribution system annually through the EPA Mandatory Greenhouse Gas Reporting Rule, Subpart W. Based on our EPA reporting, we estimate the leak rate¹² from our distribution system was approximately 0.146% in 2020, the most recent year with data available. In addition to the mandatory EPA

¹⁰ *Direct Measurements Show Decreasing Methane Emissions from Natural Gas Local Distribution Systems in the United States*; Brian K. Lamb, Steven L. Edburg, Thomas W. Ferrara, Touché Howard, Matthew R. Harrison, Charles E. Kolb, Amy Townsend-Small, Wesley Dyck, Antonio Possolo, and James R. Whetstone; Environmental Science & Technology 2015 49 (8), 5161-5169; DOI: 10.1021/es505116p.

¹¹ NGSI *Methane Emissions Intensity Protocol*, Version 1.0, at pages 33-34. See [ngsi_methaneintensityprotocol_v1.0_feb2021.pdf \(aga.org\)](https://www.aga.org/ngsi-methaneintensityprotocol-v1.0-feb2021.pdf).

¹² MMscf of methane emissions per MMscf of methane throughput.

reporting, we have joined [ONE Future](#), a coalition of over 50 natural gas companies working to expand emissions reporting and collectively limit methane emission intensity across the entire natural gas supply chain to 1% or less of throughput by 2025. By joining ONE Future, the Company is committing to keep our methane emissions rate at or below 0.2% from the distribution system.

b. Proposed methodology for reporting fugitive methane emissions

As discussed above, we report methane emissions from the distribution system annually through the EPA Mandatory Greenhouse Gas Reporting Rule, Subpart W. We propose relying on the EPA reporting to estimate methane emissions from the distribution system. This reporting is independently verified and publicly reported by EPA. Note that because EPA Subpart W data for 2021 is not yet available, the figure included in the Attachment A metrics list for our distribution system methane leak rate is for 2020. Due to the time required for verification, reporting to EPA and publication by EPA, Subpart W data for a prior year is generally not available until the fall of the following year. In the performance metrics annual report each April, we propose to report this metric for two years prior (all other metrics being for the prior year).

As noted above, emissions from upstream and midstream operations are outside of Xcel Energy's direct control, and requiring quantitative reporting metrics for reducing these emissions would therefore appear to violate the Commission's design principles in this docket. For this reason, we propose reporting a quantitative metric only for methane emissions on the Company's distribution system. However, in the next section we provide a qualitative discussion of efforts the Company is taking to influence disclosure of emissions data and emissions reductions from upstream and midstream operations.

8. Upstream Methane Emissions (NEW)

In its February 9, 2022 Order in the instant docket, the Commission included a new requirement as Order Point 6:

Xcel [Energy] must include in its PBR annual reports information on: availability of data specific to its gas suppliers on upstream methane emissions; regulation of methane emissions upstream of the Company's distribution system, and the Company's position on such regulations; participation in voluntary initiatives to quantify and reduce methane from gas suppliers; any certified gas purchases; pilots with gas marketers to track and source gas with lower associated methane emissions; and any other actions the Company has taken to secure data on and/or reduce upstream methane emissions. No later than 2024, the Company will re-evaluate data available on upstream methane to consider feasibility of reporting of methane emissions attributable to total natural gas purchases across the full fuel cycle (from drilling and extraction to the end-use).

Upstream methane emissions data specific to Northern States Power Minnesota's (NSPM) gas suppliers is not available at this time. As explained in our 2020 Annual Report¹³ and discussed further in the December 16, 2021 hearing, NSPM's gas purchasing is not direct from gas producers at the wellhead, but rather from market centers that are aggregating gas supply from multiple sources. Currently we do not have a means to determine the source of each quantity of purchased gas with certainty; suppliers may change daily, and there is no contractual or legal obligation for the seller to provide methane emissions data. Emissions from upstream and midstream operations are outside of Xcel Energy's control as they occur before we receive gas. Nonetheless, Xcel Energy is working to influence gas producers and suppliers to reduce these upstream and midstream emissions, as well as to improve disclosures of emission data. We describe those efforts here.

Xcel Energy was the first major U.S. energy provider to announce aggressive goals for reducing greenhouse gas emissions across three large sectors of the economy: electricity, natural gas use in buildings, and transportation. In November of last year, the Company announced a net-zero vision for natural gas by 2050, with an interim goal to reduce greenhouse gas emissions 25% by 2030. The 2030 interim goal includes sourcing only certified low-methane emissions natural gas for both power generation and gas distribution and achieving net-zero methane emissions on our gas distribution system. The scope of our net-zero vision for natural gas spans the entire supply chain from upstream production to customer end use. For more information, please see our report, [Net-Zero Vision for Natural Gas](#).

Regarding the regulation of upstream methane emissions Company's position, on January 31, 2022, we submitted a comment letter in general support of EPA's direct regulation of methane emissions from the upstream oil and gas sector. The proposed rule establishing new source performance standards (NSPS) and emissions guidelines (EG) for the Crude Oil and Natural Gas source category under the Clean Air Act was published in the Federal Register on November 15, 2021, (86 FR 63110). EPA estimates the proposed rule would reduce methane by 41 million metric tons from 2023-2035 (920 MT CO₂e), a 75% reduction from covered sources by 2030 compared to 2005. Please see the Company's letter to EPA, provided as Attachment C.

The Company also participates in voluntary initiatives to quantify methane from gas suppliers and to reduce upstream emissions. Starting with gas procurement for 2021,

¹³ *In the Matter of a Commission Investigation to Identify and Develop Performance Metrics, and Potentially, Incentives for Xcel Energy's Electric Utility Operations*, Docket No. E002/CI-17-401. 2020 ANNUAL REPORT. April 30, 2021, pages 16-17.

we included in our request for purchase proposals a voluntary request for disclosure of methane intensity based on the Natural Gas Sustainability Initiative's [Methane Emissions Intensity Protocol](#) and best practices. No producers provided the requested voluntary information. However, as noted above, since the gas supply is aggregated at a market center from various potential upstream sources, sellers may not be able to specify a unique source for the supply.

Additionally, the Company is actively engaged in [ONE Future](#), a coalition of over 50 natural gas companies representing more than 20% of the U.S. natural gas value chain working to expand emissions reporting and collectively limit methane emission intensity across the entire natural gas supply chain to 1% or less of throughput by 2025. In 2020, ONE Future members across all segments (production, gathering and boosting, processing, transmission and storage, and distribution) collectively achieved an intensity of 0.424%. The following methane intensities were achieved by members in the upstream and midstream sectors individually:

- production sector achieved 0.105%, beating the 2025 target of 0.283%
- gathering and boosting sector achieved 0.042%, beating the 2025 target of 0.080%
- processing sector achieved 0.017%, beating the 2025 target of 0.111%
- transmission & storage sector achieved 0.142%, beating the 2025 target of 0.301%

Regarding “certified natural gas” (CNG) purchases and pilots, the Company continues to monitor and support the growing market for CNG, i.e. natural gas that has been certified by an independent third party to be produced with a low methane intensity and advanced technology to measure and monitor methane emissions. Recently, Xcel Energy set ambitious goals for its natural gas business, which includes CNG purchasing, as discussed above. However, we are still early in the implementation process, and it may take several years for sellers to be able to provide methane intensity certificates for gas purchases at market centers where direct purchasing from producers is not available. We will continue to report progress on this front in future annual reports.

The Company has not yet made any CNG purchases in NSPM, where we buy from market centers. CNG sourcing is more feasible in the near term in the Company's Colorado service territory, where there is opportunity to purchase natural gas direct from producers. In Colorado, we have already begun a pilot with a seller willing to provide CNG without a premium to establish proof of concept. Since June of 2021, we have purchased a small quantity of CNG from Crestone Peak Resources that has been certified by Project Canary to have low methane intensity (<0.25%) for the local distribution system in Colorado. The pilot currently provides enough natural gas to heat about 20,000 homes per day and will continue through winter of 2022. Xcel Energy as a whole is learning from this pilot.

When conducting our annual gas purchase auctions for Minnesota starting in April of 2022, we plan to request CNG bids as well as traditional gas supply bids. However, until the CNG production market further develops, we expect a limited amount of certified gas to be available, so we do not expect significant quantity offers in the near term. According to [S&P Global Platts](#), roughly 14% of U.S. production is anticipated to be certified by the end of 2022; however, programs are currently focused on the Haynesville and Appalachia production regions, which do not supply Minnesota customers.

We plan to work with the Commission to develop strategy for the purchase of CNG and the recovery of related costs in the future. CNG purchases are not currently addressed within the gas supply plans we submit to the Commission. If CNG suppliers demand a market premium for CNG products, we must address this issue with the Commission before committing to purchases with a higher cost than standard natural gas. There are several possible regulatory mechanisms that could be used to address CNG purchases, including a new miscellaneous docket regarding monthly purchased gas costs, future gas rate cases, or in one of the dockets related to the Natural Gas Innovation Act such as G999/CI-21-565.¹⁴

9. Inclusion of Upstream Methane in Calculation of GHG Emissions Avoided by Electrification of Buildings, Agriculture and Other Sectors (NEW)

In its February 9, 2022 Order in the instant docket, the Commission included a new requirement as Order Point 7:

Xcel [Energy] must include in its report, once the Commission has determined adequate data on upstream methane is available to support utility-specific reporting of such emissions, methane emissions across the full fuel cycle in its calculation of greenhouse gas emissions avoided by electrification of buildings, agriculture, and other sectors.

As described in No. 8 above, adequate data on upstream methane is not yet available to support utility-specific reporting of such emissions. The Company will continue to report on its efforts to improve upstream methane data and reduce upstream methane emissions in future annual reports. Once the Commission has determined adequate data is available, the Company will begin including avoided upstream methane emissions in its calculation of greenhouse gas emissions avoided by electrification of buildings, agriculture, and other sectors.

¹⁴ *In the Matter of a Commission Evaluation of Changes to Natural Gas Utility Regulatory and Policy Structures to Meet State Greenhouse Gas Reduction Goals*. PUC Docket Number: G999/CI-21-565. Noticed July 23, 2021.

III. STAKEHOLDER DISCUSSIONS AND ASSOCIATED FILING REQUIREMENTS

The Commission's April 16, 2020 and February 9, 2022, Orders directed the Company to engage in stakeholder discussions and development of a demand response financial incentive as well as feedback on our proposed performance scorecard. We provide additional detail on each of these requirements below.

A. Demand Response Financial Incentive

Page 8 and Order Point 1.f. of the Commission's Order directed Xcel Energy to work with stakeholders and the Department to develop a demand response financial incentive. Order Point 1.f. states as follows:

[F]urthermore, the Commission will direct Xcel to work with stakeholders and the Department to develop a demand response financial incentive, and to file a proposal for Commission consideration by the end of the first quarter of 2021. Demand response is an important resource for keeping the evolving grid efficient and reliable, and it can reduce peak demand, resulting in cost savings for customers and for the utility. It is important to begin the process of researching and considering financial incentives to encourage achievements in demand response when such achievements would be beneficial to the utility system and to customers.

In compliance with that Order, the Company filed an incentive proposal in Docket No. E002/M-21-101. Although the Commission did not approve the incentive in their hearing held on January 6, 2022, the Company was encouraged to address future incentives for demand response through the Conservation Improvement Plan as contemplated by the Energy Conservation and Optimization Act of 2021 (ECO) and found in Minnesota Statute § 216B.2401.¹⁵

B. Dashboard

The Commission issued a February 9, 2022 Order directing the Company to:

[H]ost one or more stakeholder meetings for stakeholders to ask questions and provide feedback on the proposed scorecard.

On February 7, 2022, the Company issued a formal Notice of Stakeholder Meeting, and a stakeholder discussion was held to address this compliance point on February 22, 2022.

¹⁵ See HF 164 passed in 2021.

Scorecard Stakeholder Group Attendees

Audrey Partridge	Center for Energy and Environment	Bridget Dockter	Xcel Energy
John Kundert	Department of Commerce	Crystal Gottschalk	Xcel Energy
Grey Staples	The Mendota Group	Mary Martinka	Xcel Energy
Will Kenworthy *	Vote Solar		

* Mr. Kenworthy was only able to attend the first few minutes of the discussion and as a result, was not included in the consensus path.

Stakeholder Discussion

The discussion began with a review of where the stakeholder group landed at our last meeting on March 2, 2021, which created the framework for the scorecard the Company submitted in its 2020 PBR Annual Report. In that discussion, the stakeholder group thought it would be valuable to develop an illustration in order to visualize an online scorecard and to help frame the context, necessity and usability of such a tool for Commission review. The illustration depicts the Commission's approved five Outcomes: Affordability, Reliability, Customer Service Quality, Environmental Performance, and Cost-Effective Alignment of Generation and Load.

In our 2020 Annual Report, we included a proposed scorecard that aligned with the discussions we had with the stakeholder group, utilizing the smaller subset that we believe parties may be most interested in, including:

- Average monthly bills for residential customers,
- SAIDI,
- Number of Customer Complaints,
- Total carbon emissions by (1) utility-owned facilities and PPAs and (2) all sources, and
- Demand response, including (1) capacity available (MW & MWh).

As the scorecard is for illustrative purposes, we provided five years of data. The 2020 Annual Report scorecard is shown below.

Category	Metric	Previous Year Trend	2020	2019	2018	2017	2016
Affordability	Average Residential Bill		\$88.28	\$83.74	\$91.30	\$84.75	\$83.73
Reliability	SAIDI		All Days: 134.19 Normalized: 98.92	All Days: 124.50 Normalized: 81.02	All Days: 125.00 Normalized: 96.07	All Days: 141.70 Normalized: 57.04	All Days: 214.39 Normalized: 90.45
Customer Service Quality	Customer Complaints		.1341 per 1000 Customers	.2244 per 1000 Customers	.1417 per 1000 Customers	.0651 per 1000 Customers	.0571 per 1000 Customers
Environmental Performance	Total Carbon Emissions		12,801,300 tons	16,229,466 tons	18,549,479 tons	18,891,471 tons	18,972,617 tons
Cost Effective Alignment of Generation and Load	Demand Response		Total Capacity: 754.6 MW 155,967 MWh	Total Capacity: 737 MW 164,716 MWh	Total Capacity: 731 MW 155,645 MWh	Total Capacity: 658 MW 134,140 MWh	Total Capacity: 723 MW 134,550 MWh

Stakeholder Group Recommendations

The stakeholder group, by consensus, agreed it is premature to develop a scorecard at this time. Aligning with the Commission’s February 9, Order¹⁶ to collect data for three years prior to developing evaluation criteria and benchmarking targets, the group determined it is preferable to postpone creating a scorecard until after establishing the evaluation criteria benchmarking targets, invest in the development of a scorecard for one set of metrics, then recreate a new one if a different set of metrics is determined to be more valuable to the end user. Additionally, if the Commission determines a scorecard should be developed in the future, the group agreed costs should be considered and a stationary image, such as the illustration above, updated once annually and hosted on Xcel Energy’s website is recommended.

Should the Commission choose to open a discussion of metric review, evaluation criteria, or benchmarking following the Annual Report filed in 2023, the group agreed that this would be a more appropriate time for a scorecard development discussion.

We have included the PowerPoint deck of that meeting at Attachment D for reference.

¹⁶ Order Accepting Report and Setting Additional Requirements; Docket No. E002/CI-17-401; February 9, 2022.

C. Work With Stakeholders to Develop Evaluation Criteria and Benchmarks and File Them at a Later Date

The Commission's April 16, 2020 Order identified a future step, to develop evaluation criteria and benchmarks with stakeholders. Specifically, the Order states:

[S]imilarly, the Commission will direct Xcel to work with stakeholders to develop evaluation criteria and benchmarks and file them at a later date. The Commission will wait until the appropriate step in the PIM process to decide on criteria for good versus bad performance, and establish benchmarks against which to measure Xcel's performance; however, the process of evaluating such criteria and benchmarks is likely to be complex and time-consuming, and the Commission will direct Xcel and stakeholders to begin that process.

Further, the Order also notes our position on benchmark development:

[X]cel also stated that it believed it was not yet time to set benchmarks for comparison or develop evaluation criteria for good versus poor performance; rather, appropriate comparison data should be developed at a later stage, after Xcel has consistently provided reports of existing data.

We requested the Commission consider three years of annual report data (2021 through 2023 reports for 2020 through 2022 data) prior to developing the benchmarking criteria. We believe this provides an adequate timeframe to develop a record and for all parties to meet to assess appropriate benchmarking criteria. This position was supported by most stakeholders, and the Commission approved the request in its February 9, 2022 Order:

[P]rovide three years of data before developing evaluation and benchmarking targets for the performance metrics.

Following the submittal of our 2023 annual report, we would be happy to engage in evaluation and benchmarking criteria discussions.

D. Workforce Transition Plan

In its February 9, 2022, Order, the Commission approved our proposed Workforce Transition Plan.

[T]he Commission adopts the Workforce Transition metric; Xcel [Energy] must obtain additional stakeholder feedback on the plan as it is developed for the 2021 annual performance metrics report.

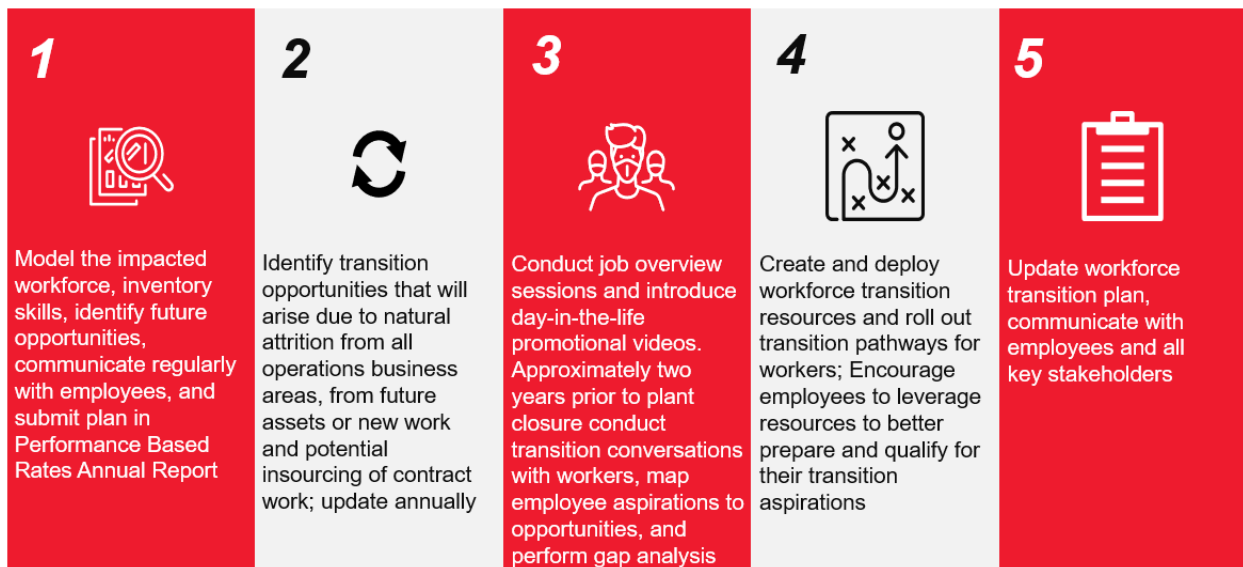

In compliance with that Order, we reached out to additional key stakeholders impacted by our Workforce Transition Plan including: the International Brotherhood of Electrical Workers (IBEW), Laborer's International Union (LIUNA), the Minnesota State Energy Center of Excellence, the Center for Energy Workforce Development (CEWD), and the Energy Providers Coalition for Education (EPCE). We appreciate the feedback stakeholders offered, and we will be considering many of their recommendations for the Transition Plan as we get closer to the date for the plants' transition. For example, stakeholders recommended an internal Company website that would provide employees with information on the status of the transition, re-training and re-location opportunities. Additionally, stakeholders indicated they will use our Transition Plan as a model to help inform other energy companies they work with during their own planned plant transitions.

Request to move reporting into new Integrated Resource Plan docket

As noted above, there is significant overlap in reporting of the Workforce Transition Plan in this docket and the new docket contemplated by the Commission's decision in the Integrated Resource Plan docket. We believe it is most efficient to report on the plan in one docket. The annual update requirements for the Transition Plan are more robust in the decision option adopted by the Commission during its February 8, 2022 deliberations; our reporting based on those requirements will provide a comprehensive illustration of our ongoing work with plant employees and stakeholders during the clean energy transition.¹⁷

Xcel Energy has a long and successful history of performing strategic workforce planning to support workers through a transition, creating and executing upon workforce plans, and enabling a smooth transition of our workforce. We have a highly skilled workforce, and it is our desire and intent to retain these skilled workers to the greatest extent feasible. The workforce transition plan included as Attachment E highlights each step of our planning and transition process for our generation fleet. Xcel Energy adopts the multi-phased approach to workforce transition illustrated below.

¹⁷ See Docket No. E002/RP-19-368, ORDER APPROVING PLAN WITH MODIFICATIONS AND ESTABLISHING REQUIREMENTS FOR FUTURE FILINGS at 39 (April 15, 2022).

CONCLUSION

In conclusion, we have provided reporting for the 33 metrics that the Commission approved on April 16, 2020 and February 9, 2022 for the period of January, 1 2021 through December 31, 2021. **We also ask for approval to move annual reporting of our Workforce Transition Plan from this Performance Based Rates docket to the new docket to be established pursuant to the Integrated Resource Plan Order in Docket No. E002/RP-19-368.**

We welcome any questions the Commission and parties may have about our 2021 Performance Metrics Annual Report and look forward to providing future annual updates. Thank you for the continued opportunity to participate in this proceeding.

Dated: April 29, 2022

1	System Average Interruption Duration Index (SAIDI): Indicates average interruption duration per customer during defined period of time.	CURRENT	Report with and without major event days. $\frac{\text{Sum of Total Sustained Customer Interruption Durations}}{\text{Total Number of Customers Served}}$ "Sustained event" = duration of more than 5 minutes Order Point: Direct Xcel to use a Normalization method consistent with the Commission's most recent Order in the Annual Service Quality, Safety, and reliability docket in reporting their SAIDI, SAIFI, CAIDI, CELID, and ASAI within this docket.	All Days: 129.94 Annual Rules Normalized: 88.79	_____	All Days: 134.19 Annual Rules Normalized: 98.92	All Days: 124.50 Annual Rules Normalized: 81.02	All Days: 125.00 Annual Rules Normalized: 96.07	All Days: 141.70 Annual Rules Normalized: 75.04
2	System Average Interruption Frequency Index (SAIFI): Indicates average number of sustained interruptions per customer over defined period of time.	CURRENT	Use Jan–Dec each year to align with current reporting. Report with and without major event days. Proposed formula: $\frac{\text{Sum of Total Sustained Customers Interrupted}}{\text{Total Number of Customers Served}}$ Order Point: Direct Xcel to use a Normalization method consistent with the Commission's most recent Order in the Annual Service Quality, Safety, and reliability docket in reporting their SAIDI, SAIFI, CAIDI, CELID, and ASAI within this docket.	All Days: 1.04 Annual Rules Normalized: 0.92	_____	All Days: 1.07 Annual Rules Normalized: 0.99	All Days: 0.86 Annual Rules Normalized: 0.75	All Days: 0.95 Annual Rules Normalized: 0.89	All Days: 0.90 Annual Rules Normalized: 0.74
3	Customer Average Interruption Duration Index (CAIDI): Indicates average time to restore service to customers that have been interrupted from sustained event.	CURRENT	Report with and without major event days. Proposed formula: $\frac{\text{Sum of Total Sustained Customer Interruption Durations}}{\text{Sum of Total Sustained Customers Interrupted}}$ Order Point: Direct Xcel to use a Normalization method consistent with the Commission's most recent Order in the Annual Service Quality, Safety, and reliability docket in reporting their SAIDI, SAIFI, CAIDI, CELID, and ASAI within this docket.	All Days: 124.67 Annual Rules Normalized: 96.31	_____	All Days: 124.89 Annual Rules Normalized: 100.28	All Days: 145.30 Annual Rules Normalized: 108.29	All Days: 131.22 Annual Rules Normalized: 107.39	All Days: 158.10 Annual Rules Normalized: 100.90
4	Customers Experiencing Long Interruption Duration (CELID): Indicates ratio of customers experiencing interruptions with duration equal to or greater than "d" during defined period of time.	CURRENT	Report with and without major event days. Proposed formula: $\frac{\text{Total Number of Customers that experienced interruptions of "d" or more hours duration}}{\text{Total Number of Customers Served}}$ Propose "d" = 24 hours. Consistent with annual Service Quality Plan, where customers experiencing outage of 24 hours or more receive \$50 bill credit for each outage occurrence lasting longer than 24 hours. Order Point: Direct Xcel to use a Normalization method	All Days 0.496% Annual Rules Normalized: 0.113%	_____	All Days: 0.339% Annual Rules Normalized: 0.133%	All Days: % Annual Rules Normalized: %	All Days: % Annual Rules Normalized: %	All Days: % Annual Rules Normalized: %
5	Customers Experiencing Multiple Interruptions (CEMI): Indicates ratio of individual customers experiencing more than "n" sustained interruptions to total number of customers served.	CURRENT	Report with and without major event days: $\frac{\text{Total Number of Customers that experience more than "n" sustained interruptions}}{\text{Total Number of Customers Served}}$ Propose "n" to be 5 sustained interruptions. Consistent with annual Service Quality Report, where customers experiencing more than 5 sustained interruptions in a year receive \$50 bill credit. Order Point: Direct Xcel to use a Normalization method consistent with the Commission's most recent Order in the Annual Service Quality, Safety, and reliability docket in reporting their SAIDI, SAIFI, CAIDI, CELID, and ASAI within this docket.	All Days: 0.674% Annual Rules Normalized: 0.467%	_____	All Days: 0.538% Annual Rules Normalized: 0.366%	All Days: % Annual Rules Normalized: %	All Days: % Annual Rules Normalized: %	All Days: % Annual Rules Normalized: %

Environmental Performance									
1	Total carbon emissions by: (1) utility-owned facilities and PPAs and (2) all sources	Began 2020 PBR Report	Leverage Xcel Energy reporting to The Climate Registry (TCR) by data "pools." • Pool 1 = owned zero-emission facilities • Pool 2 = owned fossil electric generating units (EGUs) equipped with continuous emission monitoring systems (CEMS) • Pool 3 = owned fossil EGUs not equipped with CEMS • Pool 4 = purchased power agreements (PPAs) • Pool 5 = short-term and spot-purchased power from known sources (to which we can ascribe a specific emissions) • Pool 6 = short-term and spot-purchased power from unknown sources in MISO market (to which we cannot ascribe a specific emissions rate so apply regional grid average CO2 rates from EPA). In calculating total carbon emissions from utility-owned facilities and PPAs only, include Pools 1-4 only. In calculating emissions from all sources, include Pools 1 through 6. We include CO2 from MISO market purchases, but deduct CO2 from trade margin sales, since this energy does not serve customers, and if energy purchasers report this CO2, would result in double-counting.	(a) Utility-owned facilities and PPAs = 13,729,970 tons (b) All sources = 13,800,098 tons.		(a) Utility-owned facilities and PPAs = 12,710,943 tons (b) All sources = 12,801,300 tons.	(a) Utility-owned facilities and PPAs = 15,193,303 tons (b) All sources = 16,229,466 tons	(a) Utility-owned facilities and PPAs = 17,132,871 tons (b) All sources = 18,549,479 tons	(a) Utility-owned facilities and PPAs = 17,537,080 tons (b) All sources = 18,891,471 tons
2	Carbon intensity (emissions per MWh) by: (1) utility-owned facilities and PPAs and (2) all sources	Began 2020 PBR Report	For carbon intensity from utility-owned facilities and PPAs only, divide total CO2 from Pools 1-4 by total generation (MWh) for resources in those pools to derive CO2 intensity in pounds per MWh. For carbon intensity from all sources, divide total CO2 from Pools 1-6 by total generation (MWh) for resources in those pools to derive CO2 intensity in pounds per MWh. We include CO2 from MISO market purchases, but deduct CO2 from trade margin sales, since this energy does not serve customers, and if energy purchasers report this CO2, would result in double-counting.	(a) Utility-owned facilities and PPAs = 667 pounds per MWh (b) All sources = 669 pounds per MWh.		(a) Utility-owned facilities and PPAs = 640 pounds per MWh (b) All sources = 643 pounds per MWh.	(a) Utility-owned facilities and PPAs = 760 pounds per MWh (b) All sources = 786 pounds per MWh	(a) Utility-owned facilities and PPAs = 829 pounds per MWh (b) All sources = 857 pounds per MWh	(a) Utility-owned facilities and PPAs = 865 pounds per MWh (b) All sources = 893 pounds per MWh
3	Total criteria pollutant emissions	Began 2020 PBR Report	Report criteria pollutant information for utility-owned facilities only. Nitrous oxide (NOx) and sulfur dioxide (SO2) emissions are tracked based upon state and federal monitoring requirements. Various emissions monitoring methods are used, depending upon facility and pollutant, including CEMS, fuel flow and fuel analysis. For particulate matter (PM), emissions are tracked based on allowed state reporting methodologies including stack test data and use of EPA AP-42 emission estimates.	• NOx: 7,318 tons • SO2: 3,886 tons • PM: 541 tons • Mercury: 0.0378 tons • Lead: 0.0563 tons Additional discussion in narrative		• NOx: 6,050 tons • SO2: 3,356 tons • PM: 472 tons • Mercury: 0.0435 tons • Lead: 0.0532 tons Additional discussion in narrative	• NOx: 7,919 tons • SO2: 4,695 tons • PM: 554 tons • Mercury: 0.0375 tons • Lead: 0.0615 tons Additional discussion in narrative	• NOx: 9,550 tons • SO2: 6,634 tons • PM: 648 tons • Mercury: 0.0355 tons • Lead: 0.0730 tons Additional discussion in narrative	• NOx: 9843 tons • SO2: 5728 tons • PM: 1006 tons • Mercury: 0.0325 tons • Lead: 0.0785 tons Additional discussion in narrative
4	Criteria pollutant emission intensity per MWh	Began 2020 PBR Report	Track and report emissions of NOx, SO2 and PM as proposed for "Total criteria pollutant emissions," and then divide those figures by total MWh of generation to derive criteria pollutant emission intensity.	• NOx: 0.479 pounds per MWh • SO2: 0.254 pounds per MWh • PM: 0.035 pounds per MWh • Mercury: 0.000002 pounds per MWh • Lead: 0.000004 pounds per MWh		• NOx: 0.416 pounds per MWh • SO2: 0.231 pounds per MWh • PM: 0.032 pounds per MWh • Mercury: 0.000003 pounds per MWh • Lead: 0.000004 pounds per MWh	• NOx: 0.509 pounds per MWh • SO2: 0.302 pounds per MWh • PM: 0.036 pounds per MWh • Mercury: 0.000002 pounds per MWh • Lead: 0.000004 pounds per MWh	• NOx: 0.575 pounds per MWh • SO2: 0.400 pounds per MWh • PM: 0.039 pounds per MWh • Mercury: 0.000002 pounds per MWh • Lead: 0.000004 pounds per MWh	• NOx: 0.619 pounds per MWh • SO2: 0.360 pounds per MWh • PM: 0.000002 pounds per MWh • Mercury: 0.000005 pounds per MWh • Lead: pounds per MWh
5(a)	CO2 emissions avoided by electrification of transportation – Alternative & Original approach	Began 2020 PBR Report	Percent of EVs in Xcel Energy's MN service territory participating in managed charging programs or on whole-house TOU rates. Proposed formula: Customers on EV-specific managed charging rates or whole-house TOU rates who have self-identified as EV owners. Number of EVs registered in Xcel Energy's service territory	• 8.61% • 1,761 • 20,449		7.23% Additional discussion in narrative.	6.16%	4.50%	3.39%
5(b)	CO2 emissions avoided by electrification of transportation – Alternative & Original approach	Began 2020 PBR Report	Percent of managed charging customers' residential EV charging load occurring during off-peak hours. Proposed formula: Total annual energy consumed (MWh) by EVs charging during off-peak hours at the residences of customers enrolled in Xcel Energy's EV TOU rates or other managed charging programs Total annual energy consumed (MWh) by EVs charging at residences of customers enrolled in Xcel Energy's EV TOU rates or other managed charging programs	• 89.5% • 4,847 MWh • 5,415 MWh		93.9% Additional discussion in narrative.	94.0%	92.8%	92.70%

OUTCOME	COMMISSION-APPROVED METRIC	NEW/CURRENT/TBD REPORTING	APPROVED CALCULATION METHOD REPORT ANNUALLY	METRICS TRACKING RESULTS AND EVALUATION FOR JAN 1, 2021 - DEC 31, 2021	ASSOCIATED REPORT ATTACHMENT	METRICS TRACKING RESULTS AND EVALUATION FOR JAN 1, 2020 - DEC 31, 2020 (as included in report filed 04/30/21)	METRICS TRACKING RESULTS AND EVALUATION FOR 2019	2018	2017
5(c)	CO2 emissions avoided by electrification of transportation – Alternative & Original approach	Began 2020 PBR Report	Calculation methodology has not changed this year and includes the following with additional detail given in the narrative: • Calculation of the total annual kWh consumption by EVs in the Company's Minnesota service territory. • Calculation of CO2 emissions from EV charging by multiplying the total annual kWh consumption by the system average CO2 rate per kWh, as reported annually to The Climate Registry and third-party verified. For EV customers who are also renewable energy tariff subscribers a rate of 0 lbs/kWh is assigned. • Calculation of CO2 that would have otherwise been emitted by gasoline vehicles for an equivalent number of miles traveled by EVs conservatively using data from DOE Alternative Fuels Data Center and EPA. • The CO2 avoidance metric is then calculated as the difference between emissions from annual EV use and displaced emissions that otherwise would have occurred from equivalent travel by gasoline vehicles.	76,895 tons Additional discussion in narrative.	_____	53,784 tons Additional discussion in narrative.	39,355 tons Additional discussion in narrative	31,376 tons Additional discussion in narrative	25,857 tons Additional discussion in narrative
6	CO2 emissions avoided by electrification of buildings, agriculture, and other sectors	Began 2020 PBR Report	Calculate CO2 avoidance based on comparison of CO2 emitted to provide same service (water heating, space heating, etc.) with electricity vs. with fossil fuel. Proposed formula: (Annual average CO2 emissions from the fossil electric appliances) – ((energy (in kWh) consumed by the electric appliance) * (Xcel Energy's annual system average CO2 rate per kWh))	No quantitative results to report for 2021. Additional discussion in narrative.	_____	No quantitative results to report for 2020 Additional discussion in narrative.	No quantitative results for 2019	No quantitative results for 2018	No quantitative results for 2017
7	Discussion of fugitive emissions of methane, including proposed methodology for reporting fugitive emissions for methane	Began 2020 PBR Report	Not included in proposed metrics and methodologies, but ordered by Commission (April 16, 2020 Order, order point 1.d) In Reply comments address our position i. Fresh Energy's proposed methane leakage rate value of 3%; the Department's recommended leakage rate of 1.87% (Department changed to .2% at the hearing); or None or <.2% based on reporting to the EPA under subpart W of the GHG Reporting Program.	Methane emissions rate on the gas distribution system controlled by Xcel Energy was 0.146% in 2019, as reported to EPA Mandatory Greenhouse Gas Reporting Rule under Subpart W. Note that for this Environmental Performance metric only, the reported data is for 2019 not 2020, since Subpart W data for 2020 is not yet available as of April 2021. Additional discussion in narrative.	_____	Methane emissions rate on NSPM Gas distribution system controlled by Xcel Energy was 0.14% in 2019, as reported to EPA Mandatory Greenhouse Gas Reporting Rule under Subpart W. Note that for this Environmental Performance metric only, the reported data is for 2019 not 2020, since Subpart W data for 2020 is not yet available as of April 2021. Additional discussion in narrative.	NA	NA	NA
8	Require Xcel Energy to include in its PBR annual reports information on: availability of data specific to its gas suppliers on upstream methane emissions; regulation of methane emissions upstream of the Company's distribution system, and the Company's position on such regulations; participation in voluntary initiatives to quantify and reduce methane from gas suppliers; any certified gas purchases; pilots with gas marketers to track and source gas with lower associated methane emissions; and any other actions the Company has taken to secure data on and/or reduce upstream methane emissions. No later than 2024, the Company will re-evaluate data available on upstream methane to consider feasibility of reporting of methane emissions attributable to total natural gas purchases across the full fuel cycle (from drilling and extraction to the end-use).	NEW	_____	Additional Discussion in narrative.	Attachment C	New metric for 2021. Nothing reported for 2020.	NA	NA	NA
9	Once the Commission has determined adequate data on upstream methane is available to support utility-specific reporting of such emissions, methane emissions across the full fuel cycle in its calculation of greenhouse gas emissions avoided by electrification of buildings, agriculture, and other sectors.	NEW	_____	We do not report yet.	_____	New metric for 2021. Nothing reported for 2020.	NA	NA	NA

OUTCOME	COMMISSION-APPROVED METRIC	NEW/CURRENT/TBD REPORTING	APPROVED CALCULATION METHOD REPORT ANNUALLY	METRICS TRACKING RESULTS AND EVALUATION FOR JAN 1, 2021 - DEC 31, 2021	ASSOCIATED REPORT ATTACHMENT	METRICS TRACKING RESULTS AND EVALUATION FOR JAN 1, 2020 - DEC 31, 2020 (as included in report filed 04/30/21)	METRICS TRACKING RESULTS AND EVALUATION FOR 2019	2018	2017
Cost Effective Alignment of Generation and Load									
1	Demand response, including (1) capacity available (MW & MWh) and (2) amount called (MW, MWh per year)	CURRENT	System Generated	(1)Total Capacity Available in MN (summer 2021) 764 Gen. 2	Integration of customer loads with utility supply - Amount of demand response that SHAPES customer load profiles through price response, time varying rates, or behavior campaigns.	New/TBD	Actual MW at system peak hour before and after rate initiation or the start of a behavioral program. As these programs mature it, will be necessary to determine how participants load would have grown over time without the program. Forecasted load avoided will be based on actual trends over time.	Shaping activities such as fuel switching and time of use rates are still being reviewed as part of our pilot efforts. Additional discussion in narrative.	_____	Shaping activities such as fuel switching and time of use rates are still being reviewed as part of our pilot efforts. Additional discussion in narrative.	NA	NA	NA
3	Integration of customer loads with utility supply - Amount of demand response that SHIFTS energy consumptions from times of high demand to times when there is a surplus of renewable generation.	New/TBD	Available MWh during times contingency events and/or shifts to particular times of the day over time. Calculations would likely be based on assumptions until a larger population of customers can be analyzed through a measurement and verification process to verify reduction in load. This calculation is the only demand respond type that will not forecast specific load – only actual shifting will be measured.	Shifting activities such as fuel switching and time of use rates are still being reviewed as part of our pilot efforts . Additional discussion in narrative.	_____	Shifting activities such as fuel switching and time of use rates are still being reviewed as part of our pilot efforts. Additional discussion in narrative.	NA	NA	NA
4(a)	Integration of customer loads with utility supply - Amount of demand response that SHEDS loads that can be curtailed to provide peak capacity and supports the system in contingency events - for Available Load	Began 2020 PBR Report	Customers with interval data to determine the actual potential demand reduction during an event, the Company completes an analysis of actual event data collected from interval data. This analysis includes the following and may differ slightly by program: <ul style="list-style-type: none"> Collection of interval data (typically five years of data is analyzed at one time); Assign day of week and holidays to hourly data; Update hourly load relief by customer (by contract); Subtract firm kW to estimate potential load relief by hour; Calculate an average 24-hour profile by month for each customer which excludes weekends, holidays and event days; Gather 10 years of system peak system data to determine the most common peak hour by month based on frequency; and Average the controllable load kW for each customer using the most common peak hours by month using weekdays (excluding holidays and weekends) in a given year. For customers without interval data (such as those for residential), every control season data is gathered from installed sample sites to determine load reduction capability for all Savers Switch participants. At the end of the control season we gather data for each sample point along with the corresponding weather for the control season year to use in our load management analysis.	Total Capacity Available in MN (summer 2021) 764 Gen. MW and 147,466 Gen. MWh.	_____	Total Capacity Available in MN (summer 2020) 755 Gen. MW and 155,967 Gen. MWh.	Total Capacity Available in MN (summer 2019) 749 Gen. MW and 165,807 Gen. MWh.	Total Capacity Available in MN (summer 2018) 718 Gen. MW and 150,451 Gen. MWh.	Total Capacity Available in MN (summer 2017) 658 Gen. MW and 134,140 Gen. MWh.
4(a) continued			The steps to produce the forecast of potential load relief are below: <ul style="list-style-type: none"> We forecast potential load relief for each sample customer by simulating interruptions for each hour given the two types of cycling strategies. The estimated potential load relief kW per customer is the difference between the observed load and the assumed cycling strategy of smart and standard switches. We estimate the potential load relief for all hours during the collection period (using the most current year data) by estimating the allowed hourly duty cycle that would be achieved by control and subtracting it from the observed kW load. The allowed duty cycle represents a simulation of the load level the AC would be controlled down to. We then average these individual load relief estimates per hour per customer class - residential or commercial. Next, using the average sample customer load relief estimates for the group from non-interrupt days across the summer, we build linear regression models with regressing sample load relief estimates against Temperature Humidity Index (using a rolling 5 year timeframe). From those regressions, a final model is selected based on statistical merit, to which we then apply corresponding system peaking weather conditions to derive a kW per customer load relief value. 						
4(b)	Integration of customer loads with utility supply - Amount of demand response that SHEDS loads that can be curtailed to provide peak capacity and supports the system in contingency events - for Actual Load Reduction Achieved	Began 2020 PBR Report	Actual load relief is determined by measurements of load during an event. We measure actual load by hour compared to the delta between the actual load and the estimated load that would have occurred without the interruption. This metric will be broken up by event for emergency and contingency events.	Total Actual Capacity called (2020) 0 Gen. MW and 2,192 Gen. MWh.	_____	Total Actual Capacity called (2020) 0 Gen. MW and 1,066 Gen. MWh.	Total Actual Capacity called (2019) 0 Gen. MW and 2,633 Gen. MWh.	Total Actual Capacity called (2018) 4 Gen. MW and 576 Gen. MWh.	Total Actual Capacity called (2017) 342 Gen. MW and 755 Gen. MWh.
4(c)	Metrics that measure the effectiveness and success of items above, individually and in aggregate.	Began 2020 PBR Report	Load factor for load net of variable renewable generation. Measurement will help determine how well Xcel Energy is shaping load to integrate with most cost-effective supply including demand response, energy efficiency and DERs. The closer to one the measurement is, the more load is being shaped.	41.20%	_____	46.79% Annual Load Factor for load net of renewable generation (w/o Hydro being considered renewable) Additional discussion in narrative.	52.05%	51.68%	51.72%

Notes

ACSI releases industry results throughout the year and updates the national index quarterly. Baseline measurements are from the summer of 1994.

**The limited-service restaurant industry was not measured in 2004 due to a change in the quarterly measurement system that was in place at that time.

***Measurement for the Internet travel industry was moved from the fourth quarter of 2013 to the first quarter of 2014.

The "All Others" score for an industry represents the remainder of the total industry market share, less the market shares of the ACSI-measured companies. It is an aggregate of a representative number of customer interviews from each of potentially hundreds of smaller companies within the industry. Individual company scores within the "All Others" category cannot be derived without additional data collection (see "ACSI Products and Services," or to generate your own ACSI score using the ACSI methodology, see "ACSI MonitorSM").

VIA FEDERAL E-RULEMAKING PORTAL

U.S. Environmental Protection Agency
EPA Docket Center
1200 Pennsylvania Ave., NW.
Washington, DC, 20460**Docket ID No. EPA-HQ-OAR-2021-0317**Re: Standards of Performance for New, Reconstructed, and Modified Sources and Emissions
Guidelines for Existing Sources: Oil and Natural Gas Sector Climate Review

On November 15, 2021, EPA published a proposed rule that establishes new source performance standards (NSPS) and emissions guidelines (EG) for the Crude Oil and Natural Gas source category under the Clean Air Act in the Federal Register (86 FR 63110). Xcel Energy appreciates the opportunity to provide general comments on the proposed Oil and Gas (O&G) Sector Rule in the context of the broader Biden-Harris Administration vision for reducing national methane emissions 30% by 2030 as presented in the US Methane Emissions Reduction Action Plan¹. In general, we support the direct regulation of methane emissions from oil and gas sector operations if the rules are cost effective, allow flexibility in compliance, and consider cumulative policy impacts.

Xcel Energy is an energy service holding company serving approximately 3.7 million electric customers and 2.1 million natural gas customers in eight states, including Colorado, Minnesota, Texas, New Mexico, Wisconsin, North Dakota, South Dakota, and Michigan. We are a vertically integrated electric generation, transmission, and distribution owner, as well as a natural gas local distribution company (LDC) owner with minor natural gas transmission and storage assets.

Xcel Energy was the first major U.S. energy provider to announce aggressive goals for reducing greenhouse gas emissions across three large sectors of the economy: electricity, natural gas use in buildings, and transportation. In 2018, we committed to delivering 100% carbon-free electricity to customers by 2050, with an interim goal of reducing carbon emissions 80% by 2030. In 2020, we pledged to power 1.5 million electric vehicles in our service areas by 2030. Most recently, in November of last year, our company announced a net-zero vision for natural gas by 2050, with an interim goal to reduce greenhouse gas emissions 25% by 2030. This 2030 commitment includes sourcing only certified low-methane emissions natural gas for both power generation and gas distribution and achieving net-zero methane emissions on the LDC. Taken as a whole, the scope of our net-zero vision for natural gas spans the entire supply chain from upstream production to customer end use. For more information, please see our report, Net-Zero Vision for Natural Gas,

¹ <https://www.whitehouse.gov/wp-content/uploads/2021/11/US-Methane-Emissions-Reduction-Action-Plan-1.pdf>

published in November of 2021². Reducing emissions attributed to the natural gas supply chain is an important part of our clean energy vision as most Xcel Energy customers rely on natural gas for heating their homes and businesses. Natural gas is especially important in the colder climates we serve in the Upper Midwest and Colorado where it remains the most affordable, dependable, and flexible home and building heating option.

As Xcel Energy is not directly regulated by EPA's proposed O&G Sector Rule, with this letter we are providing general rather than technical comments. We appreciate the explicit exclusion of LDCs from the source category. Xcel Energy also supports direct regulation of upstream methane emissions and federal action that integrates existing state rules, such as those already implemented in Colorado which are proven successful without high costs. This is a commonsense approach that can reduce regulatory burden and minimize costs to consumers while achieving necessary emissions reductions. It is also important to provide flexibility in federal regulations to leave room for voluntary or state actions that may go further. For example, such a regulation could help support a robust, verifiable, and additional certified natural gas market, which may incentivize additional emissions reductions upstream and across the supply chain.

It is important to recognize that attaining zero emissions from the natural gas supply chain is likely not feasible, cost-effective, nor necessary to meet climate goals. Accordingly, Xcel Energy's goal to achieve net, rather than absolute, zero methane emissions on our LDC allows any remaining emissions that cannot be directly reduced to be offset. Likewise, EPA's proposed rule covering upstream emissions achieves meaningful reductions without requiring zero emissions. We strongly encourage this same approach to Department of Transportation's Pipeline and Hazardous Materials Safety Administration (PHMSA) forthcoming Methane Leak Detection Repair Rule required by the PIPES Act. Xcel Energy plans to engage in the PHMSA rulemaking which we anticipate will directly impact natural gas LDCs.

Finally, we also advise that the cumulative impact of all regulatory and policy actions taken to reduce emissions from the O&G sector be considered. Actions taken should be complementary and avoid unnecessary increases in cost while reducing emissions. It would be contrary to the objective of significantly reducing the nation's greenhouse gas emissions if overregulation inadvertently advantaged coal over natural gas for electric generation.

Thank you for this opportunity to provide comments. We look forward to engaging on the issue of reducing methane emissions from the O&G sector. If there are any questions about the issues presented herein please contact me or Jeff Lyng, Director of Energy & Environmental Policy, at Jeff.R.Lyng@xcelenergy.com or (303) 294-2005.

Sincerely,

Frank P. Prager
Senior Vice President, Strategy, Planning & External Affairs

PERFORMANCE BASED RATEMAKING: DASHBOARD STAKEHOLDER MEETING

February 22, 2022

AGENDA

1. Introductions
2. Meeting Objectives
3. Background
4. Dashboard Discussion
5. Next Steps

Introductions

- Name
- Organization

Stakeholder Meeting Objectives

1. Follow Commission Order: Xcel [Energy] must host one or more stakeholder meetings for stakeholders to ask questions and provide feedback on the proposed scorecard. (Order Point 8).
2. Follow the same transparent and collaborative stakeholder process utilized in the Performance Based Ratemaking (PBR) metric development.
3. Compile feedback to submit in PBR annual report due April 30, 2022.

Background

- Stakeholder workshop held March 2, 2021, to discuss current PBR scorecards, scorecard development options, and potential costs
 - Hawaiian Electric and Ontario Energy Board
 - Cost estimates to develop and maintain
 - Very broad - \$325k – \$1.5M
 - Next Steps
 - Group Guidance
 - Filed in 2020 PBR Annual Report

Ontario Energy Board
<https://www.oeb.ca/html/pe>

Custom Performance Report

Previous Stakeholder Group Guidance

As filed in Dashboard Stakeholder Summary & PBR Annual Report

IV.

p(5) The stakeholder group decided it would be valuable to be able to visualize an illustrative example of a prioritized online scorecard/dashboard, utilizing the Commission's approved five Outcomes of: affordability, reliability, customer service quality, environmental performance, and cost-effective alignment of generation and load. The illustration will include some of the associated metrics under these outcomes and will be split to the best of our ability into residential and commercial. The illustration will not include all 17 approved metrics, but items we believe at this time may be of most importance to our customers, offering a simplified view and approach. We will include the illustration in our first annual report filing April 30, 2021.

Scorecard as filed in 2020 PBR Annual Report

Performance Metrics Scorecard

April 30, 2021

Category	Metric	Previous Year Trend	2020	2019	2018	2017	2016
Affordability	Average Residential Bill		\$88.28	\$83.74	\$91.30	\$84.75	\$83.73
Reliability	SAIDI		All Days: 134.19 Normalized: 98.92	All Days: 124.50 Normalized: 81.02	All Days: 125.00 Normalized: 96.07	All Days: 141.70 Normalized: 57.04	All Days: 214.39 Normalized: 90.45
Customer Service Quality	Customer Complaints		.1341 per 1000 Customers	.2244 per 1000 Customers	.1417 per 1000 Customers	.0651 per 1000 Customers	.0571 per 1000 Customers
Environmental Performance	Total Carbon Emissions		12,801,300 tons	16,229,466 tons	18,549,479 tons	18,891,471 tons	18,972,617 tons
Cost Effective Alignment of Generation and Load	Demand Response		Total Capacity: 754.6 MW 155,967 MWh	Total Capacity: 737 MW 164,716 MWh	Total Capacity: 731 MW 155,645 MWh	Total Capacity: 658 MW 134,140 MWh	Total Capacity: 723 MW 134,550 MWh

Feedback/Discussion

- For illustration, group agreed to one metric per each of the five outcomes, does that seem appropriate?
- Recommend using a consistent set of metrics moving forward, are these the ones we want?
- Does it make sense to instead look at creating a dashboard once PIM's are established for easy public access to how the Company is performing on those?
- Annual updates with PBR reporting?

Next Steps

Meeting summary and any consensus recommendations will be filed following our discussion and included in the PBR Annual Report, due April 30, 2022, in accordance with the Commission's February 9, 2022, Order approving the 2021 PBR Annual Report, both in Docket No, E-002/CI-17-401 .

INTRODUCTION

BACKGROUND

Leading the clean energy transition is one of Xcel Energy's corporate priorities. We were the first major US electricity provider with a vision to serve customers with 100% carbon-free electricity by 2050 and to reduce carbon emissions company-wide by 80% from 2005 levels by 2030.

For the second year in a row, we had our largest annual decline in carbon emissions in 2020, reducing carbon emissions overall by 51% from 2005 levels, putting us more than halfway to our vision of delivering 100% carbon-free electricity to customers by 2050.

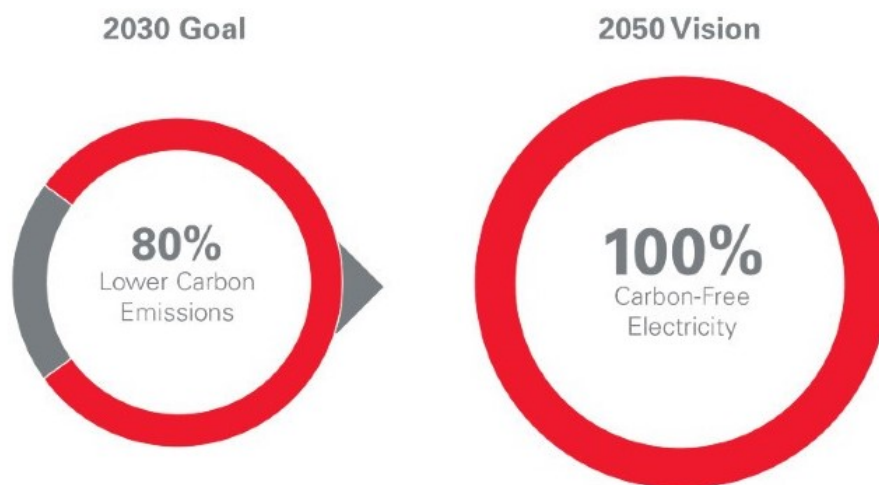

Figure 1. Building our carbon-free future.

To achieve our goal in Minnesota, we plan to retire our existing coal plants by 2030, expand our use of wind and solar systems, build on our successful energy efficiency programs and demand response options, and add new transmission infrastructure to connect more clean energy to the grid. We have a highly skilled and experienced workforce that we plan to transition to new and existing jobs across Xcel Energy. Our workforce is an important part of our clean energy vision.

WORKFORCE TRANSITION

Outlined in this workforce transition plan are planning, headcount, and cost estimates with respect to workforce transitions that will occur as a result of the proposed retirement of electric generating facilities. Xcel Energy will file a workforce transition plan update as part of the Performance Based Rates Annual Report, pursuant to the Minnesota Public Utilities Commission's (Commission) February 9, 2022, Order Accepting Report and Setting Additional Requirements. It is important to note that this workforce transition plan will continue to be updated over time so that all the estimates incorporate the latest information and assumptions.

Xcel Energy has a long and successful history of performing strategic workforce planning to support workers through a transition, creating and executing upon workforce plans, and enabling a smooth transition of our workforce. We have a highly skilled workforce, and it is our desire and intent to retain these skilled workers to the greatest extent feasible.

While transition plans for impacted employees at the Sherburne County Generating Station (Sherco) and Allen S. King Generating Plant (King) facilities are still under development, Xcel Energy continues to engage in significant and deliberate workforce transition planning efforts. The Company has been communicating regularly with plant employees, IBEW local unions and building trades unions to ensure transparency and to maintain engagement.

This workforce transition plan will highlight each step of the planning and transition process. The outcomes of each phase will be updated as workforce transition planning progresses, when plant retirement dates near, as future jobs and skills become more transparent, and as the Company evaluates existing opportunities for impacted workers across the organization.

STRATEGIC WORKFORCE PLANNING DEPARTMENT

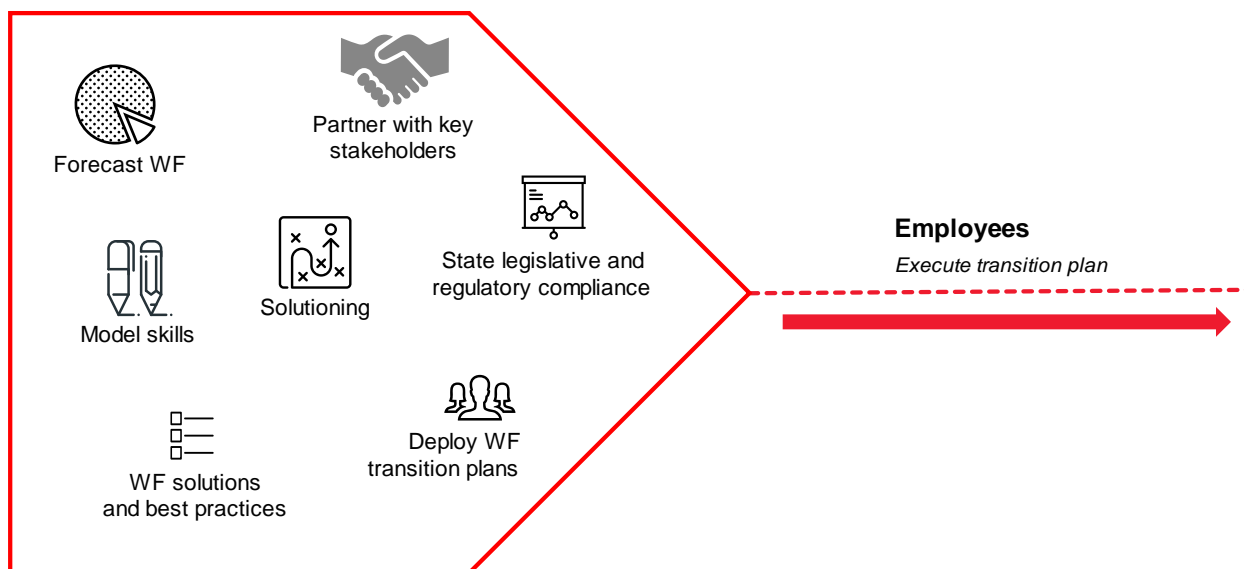

The Strategic Workforce Planning (SWP) department is housed within the Human Resource and Employee Services business area at Xcel Energy. The SWP department routinely performs workforce modeling to forecast headcount and costs, identify risks and opportunities, assess skill profiles across jobs and business areas, align the workforce to strategic priorities, and deploy workforce solutions based on data-driven insights. The SWP department holds the responsibility of creating and executing upon a workforce transition plan, in partnership and collaboration with multiple solution owners and key stakeholders.

The SWP department consists of workforce analytics consultants and analysts with a data science background and leadership consulting skills.

WORKFORCE TRANSITION PLANNING COLLABORATION

The SWP department at Xcel Energy works closely with both internal and external key stakeholders and partners to model, plan, design, and facilitate workforce transition.

Figure 2. Workforce transition planning collaboration.

Key internal partners and stakeholders include, but are not limited to:

- Human Resources and Employee Services Departments
 - Strategic Workforce Planning (SWP)
 - Workforce Relations (WFR)
 - Human Resources Business Partners (HRBPs)
 - Enterprise Learning Organization (ELO)
 - Workforce Analytics (WFA)
- Operations business areas
 - Energy Supply - Generation
 - Distribution
 - Transmission
 - Gas

XCEL ENERGY

MINNESOTA WORKFORCE TRANSITION PLAN

- Northern States Power Minnesota (NSPM) operating company
 - Resource Planning
 - State Government Affairs
 - Community Relations

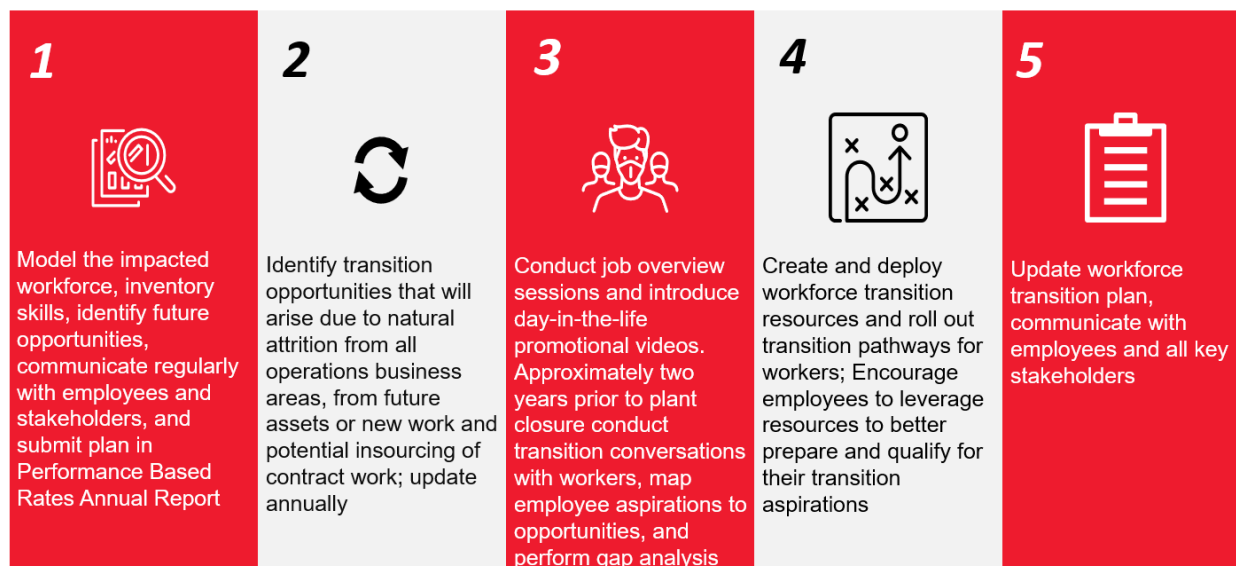

Key external partners and stakeholders include, but are not limited to:

- IBEW local unions representing Xcel Energy employees
- Minnesota building trades labor unions whose members work for Xcel Energy and its contractors
- Center for Energy Workforce Development (CEWD)
- Minnesota State Energy Center of Excellence
- Energy Providers Coalition for Education (EPCE) and their education partners
- Local education partners, community colleges and universities across the state
- All local workforce centers across the state of Minnesota

WORKFORCE TRANSITION PLANNING PROCESS PHASES

To facilitate workforce transition in Minnesota, the SWP department continues to adopt the multifaceted approach described above to enable a smooth transition at coal plants. The process of planning for workforce transition is as follows:

Figure 3. Transition workforce planning process.

PHASE 1

WORKFORCE TRANSITION PLANNING MODELING

It is important to note that the following estimates were derived and updated as of **December 31, 2021** and will continue to be updated as more refined input becomes available with respect to plant retirement, future opportunities that become available, and employees' aspirations and skills.

Furthermore, both the headcount and cost estimates will be refined once each employee participates in the transition conversations (which occur approximately two years prior to closure) and we are able to gain greater insight into the aspirations of our workers, their skills, available local opportunities, and programs we need to build or deploy to enable a smooth transition.

WORKFORCE HEADCOUNT MODELS

Detailed workforce analysis was conducted to estimate the number of potential impacted employees at each plant and identify the solutions required to transition these employees. This analysis is completed within the SWP department and in collaboration with other data analysts within Xcel Energy's Energy Supply and Resource Planning business areas.

Table 1. Projected headcount and the number of employees to transition at Sherco.

Plant	Sherco		
	<i>2023 EOY Unit 2 Closure</i>	<i>2026 EOY Unit 1 Closure</i>	<i>2030 EOY Unit 3 Closure</i>
Current Headcount As of December 31, 2021	201		
Target Headcount At closure	199	176	138
Projected Headcount Without backfilling	160	102	29
Understaffed Level Without backfilling	(39)	(74)	(109)
Projected Headcount With backfilling	199	176	138
Employees to Transition	0	0	138

* Notes:

- There are 36 non-operations employees beyond the operations target headcount of 102 who do not report to plant leadership, totaling 138 employees needed through 2030.

Table 2. Projected headcount and the number of employees to transition at King.

Plant	King
Event	<i>2028 EOY Closure</i>
Current Headcount As of December 31, 2021	76
Target Headcount At closure	74
Projected Headcount Without backfilling	(5)
Understaffed Level Without backfilling	(64)
Projected Headcount With backfilling	74
Employees to Transition	74
Number of Employees with Retention Agreements	(11)
Remaining Employees to Transition	63

* Notes:

- The Company and the union have already reached agreement with 11 Operators to secure their employment at the King plant up until closure. The agreement includes transfer to Operator positions at other nearby plants.
- There are 10 non-operations employees beyond the operations target headcount of 64 who do not report to plant leadership, totaling 74 employees needed through 2028.

Definition of workforce variables used in Tables 1 and 2:

- **Event**
Proposed early retirement dates.
- **Current Headcount**
Number of Xcel Energy benefitted employees working at the plant as of December 31, 2021. These numbers do not include supplemental building trade workers who are employed by either Xcel Energy or by contractors.

- **Target Headcount**

The number of employees needed to run the remaining units. Through continued collaboration with the Company's Energy Supply team, we estimated the number of Xcel Energy employees that would, at a minimum, be needed to operate the plant up to and at the time of closure.

- **Projected Headcount (without back-filling)**

Current Headcount less projected retirement and non-retirement attrition and transfers from December 31, 2021 up to the early retirement date. Without back-filling assumes employees who retire or leave the organization are not replaced.

- **Understaffed Level (without back-filling)**

Target Headcount less Projected Headcount; to calculate the number of employees (understaffed)/overstaffed to the minimum Target Headcount of employees needed to operate a unit if employees who retire or leave the organization are not replaced.

- **Projected Headcount (with back-filling)**

Current Headcount less projected retirements and non-retirement attrition and transfers from December 31, 2021 up to the Event date. In our projection with back-filling, employees who retire or leave the organization are replaced up to, but not exceeding, the Target Headcount.

- **Employees to Transition**

This is the number of employees to be retained through transfer within the plant, within other generating units or within other business areas across the organization. This number represents the number of employees who will be transitioned due to the retirement of a facility. To the extent feasible, we do not anticipate any layoffs. Our intent is to retain our employees and redeploy across the organization. Opportunities for these workers are outlined below in the *Phase 2, Future Opportunities for Impacted Workers* section of this report.

- *Sherco Unit 2 Closure*

Employees to Transition is equal to Projected Headcount (with backfilling) less Target Headcount at closure. Previously backfilled workers will flow to positions at the remaining operating units (i.e., Unit 1 and Unit 3).

- *Sherco Unit 1 Closure*

Employees to Transition is equal to Projected Headcount (with backfilling) less Target Headcount at closure. Previously backfilled workers will flow to positions at the remaining operating unit (i.e., Unit 3).

- *Sherco Unit 3 Closure*
Employees to Transition is equal to Target Headcount at closure. There is no Projected Headcount beyond 2030, which is the final unit closure date; as more information becomes available, these estimates will be updated accordingly.
- *King Closure*
Employees to Transition is equal to Projected Headcount (with backfilling) minus the number of employees with retention agreements.
- **Number of Employees with Retention Agreements**
This number represents the number of employees with agreements to remain at the King Plant through closure along with transfer to nearby plants.
- **Remaining Employees to Transition**
This number represents the number of Employees to Transition minus the number of Employees with Retention Agreements. We will need to retain a number of employees for demolition after closure.

The SWP department uses target headcount and attrition forecasts in the workforce planning models to estimate the number of impacted employees at each plant. Energy Supply provides the target headcount in resource planning models and Workforce Analytics provides the retirement and non-retirement attrition projection data. These estimates are early projections and will continue to be updated annually and leading up to the retirement of each unit.

- Workforce Analytics at Xcel Energy uses an actuarial-based attrition simulator to forecast Company turnover, both retirement and non-retirement.
 - Non-retirement attrition percentages are based on historical Xcel Energy experience.
 - Retirement attrition percentages are based on inputs such as the employee's age, service, and selected retirement plan.

Target headcounts for the plants were derived by the plant directors at each plant location in Energy Supply. The plant directors created a workforce plan to identify the number of people they need in each job to continue safe operation of the remaining units. These projections are estimates and may be updated as we approach retirement of these units and when resource needs are more easily identifiable.

The above tables and calculations do not include supplemental workers that the Company uses on an as-needed basis or for major overhauls of the units. Supplemental

workers are provided either directly by the building trade unions or by the contractors through which we source to execute on these activities.

WORKFORCE COST MODELS

Cost models of potential transition resources have been developed that include, but are not limited to, internal technical training, internal enterprise-wide learning courses, external educational assistance, relocation, and voluntary severance/early-exit.

Based on similar transitions of other coal plants across our service territory, primary transition resources needed to transition a workforce were identified, and high-level cost projections associated with the anticipated closure of our remaining coal units in Minnesota were conducted.

Table 3. Estimated cost of potential transition resources.

Plant	Sherco Unit 2	Sherco Unit 1	Sherco Unit 3	King
Event	Closure	Closure	Closure	Closure
Internal Tech Training	\$0	\$0	\$6,150,000	\$1,650,000
ELO Training			\$150,000	\$150,000
External Industry Training	\$0	\$0	\$160,200	\$44,500
On-the-Job Training				
Tuition Reimbursement	\$0	\$0	\$189,000	\$47,250
Relocation	\$0	\$0	\$60,000	\$20,000
Severance				
Subtotal	\$0	\$0	\$6,709,200	\$1,911,750
Grand Total	\$8,620,950			

Approximately \$8,620,950 of employee transition costs (Table 3) were estimated, dependent upon final closure date, based on the total cost of the combined transition resources applied to the total number of potentially affected workers for Sherco and King; reported as “Employees to Transition” in Tables 1 and 2. The costs are early estimates and will continue to evolve as we learn the aspirations of our workers, as attrition projections materialize, and as we learn of new opportunities within the communities these plants reside.

The assumptions used in each transition resource line item in Table 3 are listed below:

- **Event**
Proposed early retirement date.
- **Internal Tech Training**
An annual cost estimate per headcount of \$25,000 is provided by the Internal Technical Training team based on existing technical training infrastructure to provide ongoing training. The duration of technical training ranges from two to four years, with an average of three years used in the cost model. The percent of employees leveraging this resource is an estimate derived from the assessment of upskilling/reskilling needs and the historical transfers during prior plant retirements in which internal technical training was leveraged to move to positions at other Xcel Energy locations. Cost estimate does not include employee wages.
- **Enterprise Learning Organization (ELO) Training**
The cost estimate for enterprise-wide transition resources by ELO is independent of the number of impacted employees who choose to leverage the resources. The ELO cost estimate of approximately \$300,000 (\$150,000 per plant) is derived based on the assessment of upskilling/reskilling needs. ELO may collaborate with local education partners to build and deploy training courses.
- **External Industry Training**
The cost estimates for external industry training (e.g., certifications, micro credentials, individual courses) are calculated based on the certificate offerings at Bismarck State College (BSC), an EPCE education partner. There are five electric- and energy-related certificates that on average require 56.4 credit hours to complete each certificate. Since some employees will choose to complete all courses in the certificate while others will elect to take several individual classes to upskill and/or reskill, we halve the average number of credit hours used in our cost modelling, rounded to 28 credit hours. Additionally, we use \$300 as the per-credit-hour cost for the BSC certificates, consistent with the EPCE member

tuition rate at BSC. The percent of employees leveraging this resource is an estimate derived from the assessment of upskilling/reskilling needs.

- **On-the-Job Training**

Cost is expected to be incurred for on-the-job training in remaining units or at locations to which employees transfer. The cost estimate for on-the-job training has yet to be determined and will be estimated as we near the retirement of each unit and after gathering employee aspirations through transition conversations.

- **Tuition Reimbursement**

We use \$5,250 in our tuition reimbursement cost estimates, consistent with the United States Code, Title 26 Internal Revenue Code, §127 Educational Assistance Programs. An average of three years is used in the cost model. The percent of employees leveraging this resource is an estimate derived from the assessment of upskilling/reskilling needs.

- **Relocation**

The relocation cost of \$10,000 per headcount is based on prior coal unit closures. The percent of employees leveraging this resource is an estimate derived from historical relocation during prior plant retirements.

- **Severance**

Though we do not anticipate layoffs and we are committed to a transition of our workforce, some employees may not execute upon the transition pathways; severance costs will be estimated as we near retirement of each unit. Cost estimates for severance are derived based on the collective bargaining agreements.

Sherco Unit 2: There are no costs of transition because Projected Headcount (with backfilling) does not exceed Target Headcount, as outlined in Table 1, "Employees to Transition." Employees may need additional training related to any uniqueness of units 1 and 3, which would result in on-the-job training costs that are to be determined but will be provided as part of future updates to the workforce transition plan.

Sherco Unit 1: There are no costs of transition because Projected Headcount (with backfilling) does not exceed Target Headcount, as outlined in Table 1, "Employees to Transition." Employees may need additional training related to any uniqueness of unit 3, which would result in on-the-job training costs that are to be determined but will be provided as part of future updates to the workforce transition plan.

Cost estimates will be refined in future updates to the workforce transition plan and after transition conversations with each employee take place and we are able to gather employee transition preferences, skill gaps, and the transition supports leveraged.

Transition conversations with employees will take place approximately two years prior to closure.

PHASE 2

FUTURE OPPORTUNITIES FOR IMPACTED WORKERS

The Strategic Workforce Planning (SWP) Department anticipates that many of the transition opportunities for plant employees at Sherco and King will be in the form of transfers to nearby locations. Some of these transfers will require upskilling or reskilling, while others will be parallel job transfers and not require additional training. Unlike plant closures in more remote areas of our service territories, Sherco and King are located near large metropolitan areas, which include a high number of service centers and other Xcel Energy facilities.

Using natural attrition forecasts as a proxy to determine the number of opportunities that will come available across all operations areas within 50 miles of the Sherco and King plants, we estimate the following between 2022 and 2030:

Table 4. Projected future opportunities within Xcel Energy at locations near Sherco based on attrition and retirement forecast across all operations areas for 2022-2030.

Sherco Plant		
	Total Projected Jobs 2022-2030	Average Number of Jobs Per Year
Non-Bargaining	2,239	249
Bargaining	426	47

Nearby Locations: Monticello, St Cloud Service Center, Montrose Service Center, Maple Grove Service Center, Albany Service Center, Waconia Service Center, 401 Nicollet Mall, 414 Nicollet Mall, Chestnut Service Center, Riverside Gen Plant, St Anthony Falls Hydro Proj, Edina Service Center, Centre Pointe, Shorewood Service Center

Table 5. Projected future opportunities within Xcel Energy at locations near King based on attrition and retirement forecast across all operations areas for 2022-2028.

King Plant		
	Total Projected Jobs 2022-2028	Average Number of Jobs Per Year
Non-Bargaining	1,904	272
Bargaining	576	82

Nearby Locations: White Bear Lake Service Center, Hugo Training Center, Centre Pointe, Rice Street Service Center, High Bridge Combined Cycle, Inver Hills Gen Plant, Wescott Lng Plant, Newport Service Center, 401 Nicollet Mall, 414 Nicollet Mall, Chestnut Service Center, Riverside Gen Plant, Riverside Training Center, St Anthony Falls Hydro Proj, Maple Grove Service Center, Edina Service Center, Wyoming Service Center, Black Dog Gen Plant, Prairie Island, Red Wing Gen Plant, Red Wing Service Center, Shorewood Service Center, Cannon Falls Service Center, Blue Lake Gen Plant

Similar analysis is conducted for all operations business areas across the state of Minnesota:

Table 6. Projected future opportunities within Xcel Energy across Minnesota based on attrition and retirement forecast for 2022-2030.

	Total Projected Jobs 2022-2030	Average Number of Jobs Per Year
Non-Bargaining	2,794	310
Bargaining	1,064	118

Many of the skills of our employees at our coal generating facilities are transferrable to other positions across the Company. We will provide employees with information about the positions in order for workers to identify the jobs in which they are most interested, and the skills required. Leaders across all operations business areas will welcome these skilled workers transitioning from the King and Sherco generating facilities into their organization.

Transition pathways will be created in partnership with each employee to retain, redeploy, or relocate workers based on their aspirations, availability, and in accordance with the collective bargaining agreement obligations. Impacted workers will be able to leverage internal and external resources to upskill or reskill in order to transition into other positions within the Company.

Figure 4. Transition across operations.

The above tables are the greater portion of the opportunities that may be available to workers who are impacted by the early retirement of our coal plants, and the Company continues to evaluate our resource mix and has proposed several solar projects near or on the plant sites that, if approved, may provide workers with future renewable energy jobs. The Company continues to work in partnership with our communities to draw new business and new jobs to the areas.

Providing insight to our employees about potential new jobs so they are aware of the different opportunities available is an important part of our transition efforts. For the purpose of ensuring employees are aware of and informed about different pathways, we plan in-person informational job overview sessions from employees who are in the positions that will come available in order to advertise potential job paths, as well as day-in-the-life promotional videos of jobs to explore.

To the extent practicable, Xcel Energy does not anticipate any layoffs. We have a strong track record in transitioning plant workers without layoffs. We are committed to a smooth transition as we continue our journey to achieve our clean energy goals.

We will continue to update all opportunities and worker outcomes in future updates, leading up to all retirement or conversion dates. In addition, we will build transparency and demonstrate the commitment to our workforce through updates to our employees, to labor unions and to key external stakeholders impacted by these closures.

Our Employees with The Minnesota Building Trades

In recognition of the work performed at the Sherco and King Plants by workers from the Minnesota Building Trades Unions, we will continue to evaluate transition options and support the transition of long-tenured workers in partnership with key stakeholders including trade union leadership, and leverage resources available to impacted workers through the local workforce centers and the MN Department of Employment and Economic Development (DEED). The Company will continue to identify options available to this workforce and will continue to adjust the workforce transition plan over time, gathering stakeholder feedback and providing updates to the Commission through the annual filing of a refreshed workforce transition plan.

To create a diverse pipeline of talent into energy jobs and continue to support the building trades from whom we have long sourced temporary, contract, and construction work, Xcel Energy has partnered with the Minnesota Department of Employment and Economic Development (DEED) to develop the Xcel Energy Power Up workforce training and development program. This program will provide workforce training of energy-related construction work and help to bring diverse candidates into the building trades. The program represents an investment in developing a diverse community of workers through the building trades and our communities across our Minnesota service territory into sustainable energy related construction jobs.

PHASE 3

TRANSITION CONVERSATIONS

Approximately two years prior to a unit retirement, transition conversations will be conducted with all employees at an impacted plant. The purpose of the transition conversation is to: (1) provide greater insight into all the opportunities available to workers; (2) gather an employee's aspirations or transition preferences, including the jobs in which they are most interested; (3) evaluate their appetite for upskilling or reskilling and the skills they brought to the position they are in; (4) determine whether they desire to relocate; and (5) address their questions or concerns about transition.

The SWP department will work collaboratively with teams across Human Resources and Employee Services to facilitate transition conversations with workers so that the Company can work in partnership with the employees and the unions on more detailed transition planning. The department created an easy-to-use data template to capture transition preferences from transition conversations with workers and designed a real-time online form that will automatically compile and aggregate data on the backend for further analysis.

SKILL MODELLING AND SKILL GAP ANALYSIS

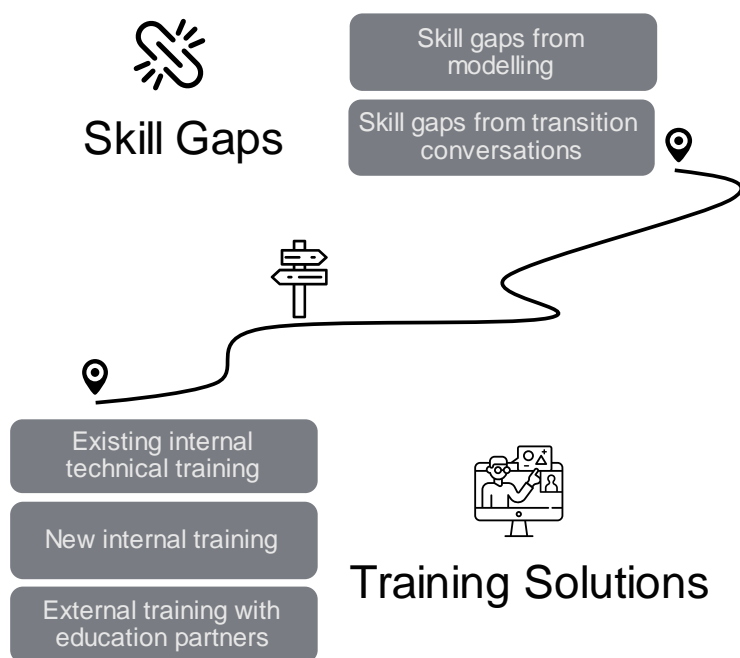

For the transition of our coal plant employees, the SWP department piloted skill inventorying and modeling for jobs at Sherco and King to help identify the skills within the positions at the plant and the skills needed to move into positions across Operations to identify skill gaps. The results of skill gap analysis will inform and guide the department in recommending and deploying the appropriate reskilling/upskilling programs for the workers to leverage, which will enable their transition.

SWP developed bargaining job skill profiles using the Center for Energy Workforce Development (CEWD) Energy Industry Competency framework as the foundation and modified it to better fit and represent the skills and competencies of Xcel Energy jobs. The skill modelling is primarily focused on the core foundational skills that are transferable and applicable to a wide array of skilled technician jobs. With the CEWD framework used for soft skills and some technical skills, we then layered in the Xcel Energy Individual Contributor competencies to represent and capture the skills associated with each position, which allows us to more easily identify where these skills are transferrable across Xcel Energy. Once the framework was complete, we consulted closely with job subject matter experts in Workforce Relations to go through each of the jobs individually to assess and rank the skills by position for both impacted positions at the coal plants and positions into which workers could potentially transition across the

organization. The outcomes were then reviewed with plant leadership for feedback and/or adjustments.

SWP has developed additional quantitative models that map skill profiles from existing plant jobs to skill profiles of potential future jobs. These models assess the degree to which existing skills match skills needed in potential future jobs, shedding light on reskilling, upskilling, and other possible training pathways for Xcel Energy employees. Using text network analysis, SWP has also developed models for assessing how suitable existing plant jobs are with potential new jobs in renewable energy as well as with existing Xcel Energy jobs.

Figure 5. Skill mapping

After transition conversations take place, we aggregate and analyze the results to identify skill gaps based on a full skill profile of the job of each worker, the skills brought to the position, and the position(s) to which they prefer to transfer in order to identify and report skills gaps. Once skill gaps are identified, we gather solutions that currently exist in upskilling/reskilling that we might be able to leverage internally or externally, what we may want to modify, or what we may consider if new upskilling/reskilling solutions need to be created to bridge the skill gap. We will look for the most cost effective solutions for the benefit of the greatest population of our workforce. We may leverage our internal training organization or external education partners in doing so.

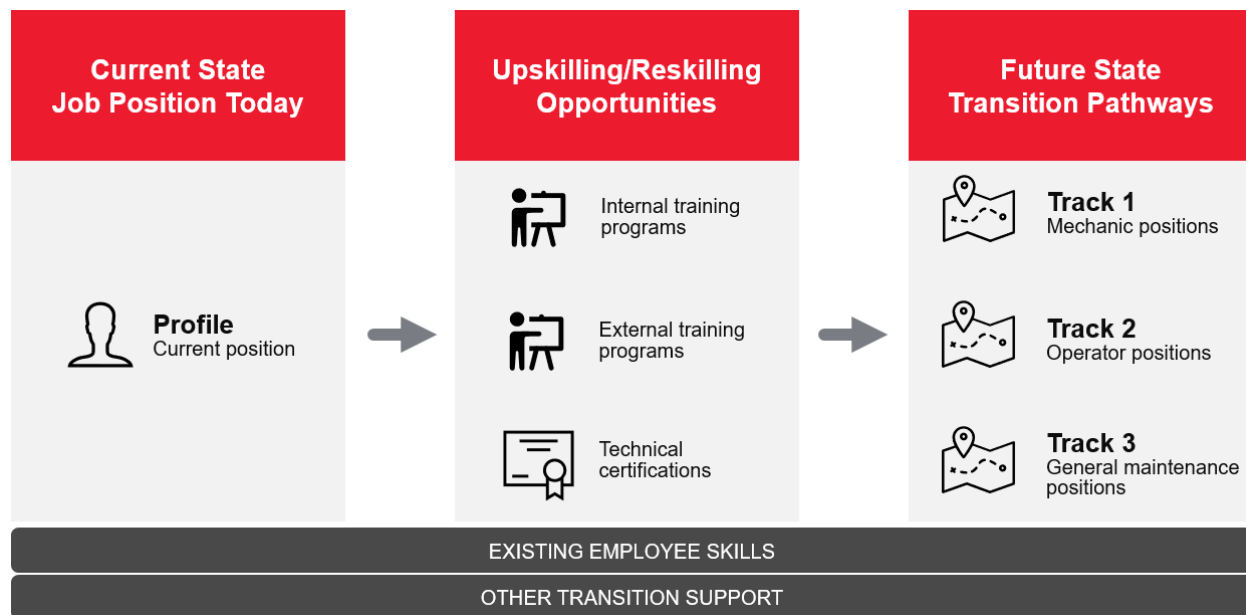

PHASE 4

TRANSITION PATHWAYS

Once skill gaps and solutions are identified, transition pathways are created for employees by leveraging existing upskilling/reskilling programs and building new upskilling/reskilling solutions with our internal and external training partners.

The transition pathways provide potential transition tracks for employees with the corresponding and recommended menu of options available for workers to transition, which would include upskilling/reskilling opportunities available plus other transition supports. The upskilling/reskilling opportunities include all internal training programs, external training programs, and technical certifications provided by external education institutions. The pathway will outline the resources available, and in some cases the timing or the schedule of these trainings (if applicable). A transition track is a collection of similar future job opportunities that likely require similar skills and training. A supervisor will provide an overview of these transition tracks to each individual employee, offering support as their leader, answers to FAQs, and any other tools or information that may be helpful to the employee. Supervisors will receive training on how best to support their employee through transition, both in process and in providing effective coaching and feedback. It will then be up to the employee to take initiative and leverage the supports offered.

Figure 6. Transition pathways.

We are an equal opportunity employer and will continue to operate in compliance with our collective bargaining agreements throughout this transition process. Xcel Energy endeavors to create and provide feasible workforce transition solutions to impacted workers.

For workers who may consider relocation to another position within the Company, we will work with the employees by looking at necessary training, the hiring process, relocation benefits, and other support, while maintaining compliance with our collective bargaining agreements. For workers who are eligible for retirement and decide to exercise that option, the HR retirement team will provide support and guidance through the retirement process.

Navigating uncertainty and change can be difficult. Xcel Energy provides numerous free resources to all employees and their family members at any time via our Employee Assistance Program (EAP), regardless of the employee's enrollment in a Company medical plan.

EAP offers information and guidance on topics including, but not limited to, managing change, handling personal crises, career counselling, educational support services, financial management and emotional well-being. Information on EAP is available to employees on the Company intranet site, XpressNET.

PHASE 5

UPDATE WORKFORCE TRANSITION PLAN

In future updates to the workforce transition plan and leading up to the retirement of our plants, we will update our plan using the latest information and assumptions in the headcount and cost models. Information gathered from the transition conversations will be used to create the transition pathways based on the results of our skill gap analysis.

Additionally, we will provide regular updates to IBEW Locals and key external stakeholders to continue to build upon the transparency of the phases and outcomes, commitment to our workforce, and our progress.

CERTIFICATE OF SERVICE

I, Mustafa Adam, hereby certify that I have this day served copies of the foregoing document on the attached list of persons.
