## RE: Petition <br> Five-Year Transmission, Distribution, and General Depreciation Study <br> Docket No. E,G002/D-17- <br> $\qquad$

Dear Mr. Wolf:

Enclosed for filing is the Petition of Northern States Power Company for approval of our 2017 Transmission, Distribution, and General Depreciation Study.

We have electronically filed this document with the Minnesota Public Utilities Commission, and summaries have been served on the parties on the attached service lists. Please contact me at lisa.h.perkett@xcelenergy.com or (612)330-6950 if you have any questions regarding this filing.

Sincerely,
/s/

Lisa H. Perkett<br>Principal Financial Consultant

In The Matter of the Petition of
Docket No. E,G002/D-17- $\qquad$
Northern States Power Company
for Certification of its Five-Year
Petition
Transmission, Distribution, and
General Depreciation Study

## Overview

Northern States Power Company, doing business as Xcel Energy, submits to the Minnesota Public Utilities Commission this Petition for certification of our 2017 Transmission, Distribution, and General Depreciation Study (Petition).

This filing is the five-year review of depreciation statistics for transmission, distribution, and general plant for the Company's electric, gas, and common utilities. The Study is based on long-standing capital asset accounting principles, Commission Orders, Minn. Stat. S§ 216B. 10 and 216B.11, and Minn. R. 7825.0500 through 7825.0900 governing depreciation.

As a result of the comprehensive Depreciation Study (Study) performed by Alliance Consulting Group, we propose new depreciation lives and rates in this Petition to better reflect the expected useful lives of our assets as well as removal costs and expected salvage. Overall, depreciation lives are lengthening slightly and net salvage rates are becoming more negative due to increasing removal costs and decreasing gross salvage values. We also recommend a change from using an Average Service Life (ASL) depreciation method to an Average Remaining Life (ARL) method. This will allow an automatic true-up of differences created between the theoretical and actual reserves over the remaining lives of the assets, incremental to the adjustment made in previous rate proceedings.

The Petition incorporates the theoretical reserve surplus adjustments made in the Company's 2012, 2013, and 2015 electric general rate cases. ${ }^{1}$ The amortization of the theoretical surplus from those cases reduced depreciation expense and lowered the accumulated depreciation for regulatory reporting for the Minnesota retail jurisdiction by $\$ 261.2$ million for the years 2013 through 2016. Since the numbers presented in this Petition are shown at total Company level, the accumulated depreciation includes the total Company theoretical reserve surplus amount of $\$ 311.3$ million so that the current theoretical depreciation reserve analysis would not inadvertently adjust for this amount again in this Petition. This is discussed further below in Section V, subsection C.4. As used in this Petition, "present rates" include the depreciation rates approved by the Commission in the Company's 2012 five-year depreciation petition. ${ }^{2}$

In the aggregate, these changes reduce the present depreciation expense by an estimated $\$ 6,903,045$ based on plant data as of January 1, 2017, as shown in Table 1 below. Common utility plant is allocated to the various utilities on the basis of customers, employee labor, or direct assignment based on actual use. In the event the Commission approves the depreciation expense change for the gas and electric utilities, the estimated electric utility decrease of $\$ 116,945$ will be reflected in the capital true-up that is part of the Company's recently approved multi-year rate plan ${ }^{3}$ and the estimated gas utility decrease of $\$ 6,786,100$ will be addressed in a future rate proceeding. The split between electric and gas utility was derived using the allocators as used in the 2016 FERC Form 1 in place as of January 1, 2017; the reduction in depreciation costs allocated to each utility would be as follows:

Table 1: Depreciation Expense Impact

|  | Estimated Change <br> to Depreciation prior to allocations | Common Utility allocations | Estimated Change to Depreciation after allocations |
| :---: | :---: | :---: | :---: |
| Electric Utility | \$ 3,683,630 | \$ $(3,800,575)$ | \$ (116,945) |
| Gas Utility | $(6,588,601)$ | $(197,499)$ | $(6,786,100)$ |
| Common Utility | $(3,998,074)$ | 3,998,074 | 0 |
| Total Estimated Impact | \$ (6,903,045) | \$ | \$ (6,903,045) |

In this Petition, we request Commission approval of the following:

[^0]- The depreciation lives and rates in the 2017 Study;
- Implementation of the new depreciation lives and rates effective January 1, 2018; and
- A change from an Average Service Life (ASL) to an Average Remaining Life (ARL) depreciation method.

## I. SUMMARY OF FILING

A one-paragraph summary is attached to this filing pursuant to Minn. R. 7829.1300, subp. 1.

## II. SERVICE ON OTHER PARTIES

Pursuant to Minn. R. 7829.1300, subp. 2, the Company has served a copy of this filing on the Office of the Attorney General - Antitrust and Utilities Division. A summary of the filing has been served on all parties on the enclosed service list.

## III. GENERAL FILING INFORMATION

Pursuant to Minn. R. 7829.1300, subp. 3, the Company provides the following information.

A. Name, Address, and Telephone Number of Utility<br>Northern States Power Company<br>414 Nicollet Mall<br>Minneapolis, MN 55401<br>(612) 330-5500

B. Name, Address, and Telephone Number of Utility Attorney

Ryan J. Long
Principal Attorney
Xcel Energy
414 Nicollet Mall, $401-8^{\text {th }}$ Floor
Minneapolis, MN 55401
(612) 215-4659

## C. Date of Filing and Date Proposed Rates Will Take Effect

This Petition is being filed July 31, 2017. The Company requests the changes be effective January 1, 2018.

## D. Statute Controlling Schedule for Processing the Filing

This request for approval of depreciation lives and rates is considered a miscellaneous filing under Minn. R. 7829.0100, subp. 11, since no determination of Xcel Energy's general revenue requirement is necessary. Comments on a miscellaneous filing are due within 30 days of filing, with replies due 10 days thereafter.

## E. Utility Employee Responsible for the Filing

Lisa H. Perkett
Principal Financial Consultant
Xcel Energy

Minneapolis, MN 55401
(612) 330-6950

## IV. MISCELLANEOUS INFORMATION

Pursuant to Minn. R. 7829.0700, the Company requests that the following persons be placed on the Commission's official service list for this proceeding:

Ryan J. Long<br>Principal Attorney<br>Xcel Energy<br>414 Nicollet Mall, $401-8^{\text {th }}$ Floor<br>Minneapolis, MN 55401<br>Ryan.J.Long@xcelenergy.com

Carl Cronin
Regulatory Administrator
Xcel Energy
414 Nicollet Mall, $401-7^{\text {th }}$ Floor
Minneapolis, MN 55401
Regulatory.records@xcelenergy.com

Any information requests in this proceeding should be submitted to Mr. Cronin at the Regulatory Records email address above.

## V. REVIEW OF DEPRECIATION RATES

## A. Background Information

This filing presents life, net salvage, and depreciation rate information for the electric and gas utilities' transmission, distribution and general plant assets, along with the common utility general plant assets. The utilities and functional groups are further broken down by the 300 -series FERC Accounts for depreciation purposes.

Depreciation is the system of accounting to distribute the cost of capital assets, less net salvage (which is gross salvage less removal cost and may be negative), over the estimated useful life of the unit in a systematic and rational manner. Depreciation is a process of allocation, not valuation. The depreciation method chosen varies depending on the type of asset and whether the asset is a homogeneous group of assets (like poles and conductor) versus an individual asset (such as a generating unit).

In the past, the Company used two basic depreciation methods: the remaining service life method for generation facilities; and the ASL method for transmission, distribution, and general property. This Petition proposes to replace the ASL method with an average life group, remaining-life depreciation system to calculate annual and accrued depreciation for transmission, distribution and general property.

The Company directed Alliance Consulting Group to perform a comprehensive Study for the transmission, distribution, and general assets for the electric, gas, and common utilities. The current depreciable lives and net salvage rates for these electric, gas, and common assets were reviewed. Their analysis included interviews with operating personnel responsible for purchase, maintenance, and utilization of the equipment. For this Study, the lives were adjusted if factors such as market forces, manufacturer expected life, technological obsolescence, business planning, known causes of retirement, and changes in expected future utilization affected the useful life of the asset.

## B. Major Future Additions and Retirements

Minn. R. 7825.0700, subp. 2B states that each utility shall provide, with the Petition for certification, a list of major future additions or retirements to the plant accounts the utility believes may have a material impact on the current certification results. The Company does not anticipate at this time any major future addition or retirement in the electric, gas, or common utility plant accounts that would materially affect the depreciation rates recommended in this study. While there are large additions planned, the assets being installed should follow the lives established for the current assets, as the type and nature does not differ between the existing and the new assets.

The absence of clearly identifiable major future additions or retirements means ongoing future additions and retirements influence life and salvage estimates, but usually do not result in dramatic changes. Rather, these additions and retirements indicate gradual changes in the life characteristics of the equipment in the account. In those cases, where ongoing additions and retirements are believed to influence the life and salvage estimates, these effects have been discussed in the individual account analyses.

## C. Summary of the Study

In the Study that serves as the foundation for this Petition (provided in Schedule D), Alliance Consulting Group first determined the appropriate present average service lives and net salvage rates for each asset group. Depending on the historical records for the different asset groups the analysis involved actuarial, semi-actuarial, and judgment methods. Then the depreciation rates were adjusted to true-up the difference between the accumulated actual reserves (accounting for the theoretical surplus amounts that adjusted these reserves in 2013-2016) and the theoretical reserves over the remaining lives of the assets. The present depreciation rates used for a comparison to the proposed depreciation rates are the rates the Commission approved in our prior five-year depreciation filing, Docket No. E,G002/D-12-858, consistent with Minn. Stat. 216B. 11 and Minn. Rule 7825.0600.

As mentioned above, depreciation lives are lengthening slightly and net salvage rates are becoming more negative due to increasing removal costs and decreasing gross salvage except for transportation and power operated equipment due to discontinuing the like-kind exchange program. Many of the schedules directly attached to this Petition are also included in more detail as part of the Study, but were extracted and summarized for easier reference. Specifically:

- Schedule A shows, by FERC account, the proposed ASL, ARL, net salvage rate, Iowa curve (where applicable), and the resulting ARL depreciation rate.
- Schedule B compares the current approved lives (Docket E,G002/D-12-858) to the proposed lives and rates.
- Schedule C shows the comparison in expected depreciation expense from current to proposed rates.

For life and net salvage analysis, the Study used total Company results. After selecting life and net salvage parameters, those depreciation parameters were applied to the total Company plant and reserve balances based on Commission-approved depreciation rates for transmission and general plant. Plant located within the State of Minnesota and corresponding reserve balances based on Commission-approved depreciation rates were used for electric and gas distribution plant. All annual accrual rates were determined using the straight line, broad group, remaining life depreciation system.

For Minnesota regulatory purposes, the depreciation expense and the accumulated provision for depreciation are based solely on the depreciation rates approved by the Commission. For financial purposes, we must account for the impact of differences in our approved depreciation rates between the various retail jurisdictions. The Schedules to this filing show the reserve amounts applicable to the Minnesota jurisdiction, shown at a total Company level. However, the depreciation reserve using Minnesota-approved lives and net salvage rates in this filing cannot be compared directly with total Company financial results reported in Securities and Exchange Commission or other financial filings.

## 1. Net Changes in Depreciation

The proposed deprecation rates, when compared to the present depreciation rates (as defined earlier) translate into an annual depreciation expense reduction of $\$ 6,903,045$, based on beginning 2017 plant levels. This reduction includes the impact of any actual to theoretical reserve differences, which are amortized over the ARL under the remaining life method proposed in this filing. A detailed comparison of present and proposed depreciation expense by utility, function, and FERC plant account is provided in Schedule C.

## 2. Proposed Changes in Service Lives

The Study provides detailed information on the proposed changes in lives and the justification for those changes. In summary, for electric transmission, distribution and general plant accounts, there are 37 accounts: 12 have increasing lives, 6 have decreasing lives, and 19 accounts were unchanged. The account where the proposed change in life caused the greatest change in the annual accrual is FERC Account 391 -Network Equipment. The life was lengthened two years for a proposed life of six years. The impact of this change is shown on Schedule C.

For gas transmission, distribution and general plant accounts, there are 31 accounts: 9 have increasing lives, 3 have decreasing lives, and 19 accounts were unchanged. The account where the proposed change in life caused the greatest change in the annual accrual is FERC Account 376 - Mains - Plastic. The life was lengthened 9 years for a proposed life of 54 years. The impact of this change is shown on Schedule C.

For common plant, there are 20 accounts, including 5 intangible accounts and 15 general plant accounts. Of these 20 accounts, 3 have increasing lives, 4 have decreasing lives, and 13 accounts were unchanged. The account where the proposed change in life caused the greatest change in the annual accrual is FERC Account 391 Network Equipment.

The life was lengthened one year for a proposed life of five years. The impact of this change is shown on Schedule C.

## 3. Proposed Cbanges in Net Salvage Rates

The Study provides detailed information on the proposed changes in net salvage rates and the justification for those changes. In summary, for electric transmission, distribution and general plant accounts, there is a trend toward higher net salvage, with 6 accounts increasing their net salvage (i.e., more positive), 13 accounts increasing their negative net salvage (i.e., more negative), and 18 accounts remaining unchanged. FERC Account 392 Transportation Equipment (all subaccounts) and FERC Account 396 - Power Operated Equipment (POE) saw an increase from zero net salvage to a range of positive 5-20 percent net salvage due to discontinuing the like-kind exchange program. These positive net salvages are offset by negative changes in various transmission and distribution accounts.

For the 31 gas transmission, distribution and general plant accounts, the proposed changes in salvage rates are more varied, with six accounts increasing their negative net salvage (i.e., more negative), seven accounts decreasing their net salvage (i.e., less negative or more positive), and 18 accounts remaining unchanged. Positive net salvage is proposed for the transportation and POE accounts similar to electric accounts above. Distribution accounts had the largest increases (i.e., more negative) to their net salvages.

For the 20 common general plant accounts, 5 accounts increased their net salvage (i.e., more positive), 1 account increasing their negative net salvage (i.e., more negative), and 14 accounts remaining unchanged. FERC Account 390 Structures \& Improvements moved from negative 20 percent to negative 25 percent. The remaining common plant accounts reflect the same changes in net salvage used for gas and electric plant.

## 4. Theoretical Reserve Analysis

A comparison of actual reserve to theoretical reserve is a gauge the Company and Commission use to review whether the accumulated depreciation is reasonable given all that has occurred in the past and all that is expected to occur in the future. Actual reserves are based on historical rates and lives, whereas the theoretical reserve is based on the current assumptions applied as if they had been in place from the beginning of an asset's useful life. Where the actual reserve is greater than the theoretical reserve, this is often called a "surplus" in reserve. A "deficit" in reserve is the opposite where the theoretical reserve is greater than the actual reserve. While a difference in the reserve amounts does not, by itself, imply an issue that needs correcting, the use of the remaining life depreciation rate will incorporate any current differences. A future
change - such as an increase in removal or negative salvage costs - could cause the difference between the actual and theoretical reserves to narrow in the future, or even go negative. Regardless of whether an account had a surplus or deficit, only $100 \%$ of the original cost plus net salvage can be depreciated.

Before each plant account was evaluated for its theoretical reserve position, the amount that was amortized for the overall theoretical surplus from previous rate filings for the electric and common utilities was incorporated into the depreciation reserve. As stated earlier, the Petition incorporates the theoretical reserve surplus adjustments made in the Company's 2012, 2013, and 2015 electric general rate cases. The amortization of the theoretical surplus from those cases reduced the accumulated depreciation for regulatory reporting for the Minnesota retail jurisdiction by $\$ 261.2$ million for the years 2013 through 2016. Since the numbers presented in this Petition are shown at total Company level, the accumulated depreciation was adjusted for the total Company theoretical reserve surplus amount of $\$ 311.3$ million so that the current theoretical depreciation reserve analysis would not inadvertently adjust for this amount again in this Petition. The amortization of the prior theoretical reserve surplus is maintained in a regulatory asset account based on FERC accounting. If this amount is not included with the depreciation reserve, the calculation of theoretical reserve surplus or deficit would include an amount that was previously dealt with by the Commission in previous rate proceedings. Schedule I shows the Minnesota jurisdiction depreciation reserve at total Company after the regulatory asset for the prior theoretical reserve surplus has been incorporated to arrive at the proper starting point for the accumulated reserve for regulatory purposes. To assist with the representation of accumulated depreciation in various schedules, Schedule K shows the linkage between the schedules.

After completing the reserve reallocation (as discussed in Subsection C. 5 below), the theoretical reserve was re-evaluated. Each plant account was evaluated and is in either a surplus or deficit position, with the overall position being a surplus. Any new surplus or deficit by account is effectively amortized over the ARL for each account through the proposed remaining life depreciation rate. The current difference between the actual and theoretical reserve is approximately $\$ 65$ million across the utilities (electric, gas, and common). This surplus represents less than $1 \%$ of the $\$ 9.1$ billion plant balance at January 1, 2017.

The following table shows the estimated reserve difference by utility:

## Table 2

Through the use of ARL depreciation rates, the future depreciation expense is adjusted to flow those surpluses or deficits back over the remaining lives of the asset groups. The ARL depreciation rates ensure that the assets are fully recovered at the end of their estimated ASL, after adjusting for net salvage assumptions, but not earlier or later than this ASL as may be the case when strictly using an ASL depreciation rate. This five-year depreciation certification filing is proposing a switch from an ASL depreciation rate to an ARL depreciation rate for the electric, gas, and common utility assets. While there are many ways to deal with this statistical difference between actual reserve and theoretical reserve (and many filings in the past prior to the 2012 depreciation petition provided the information without any implications to the overall depreciation rate), the Company believes that the best course of action to deal with future theoretical reserve differences should be through the ARL depreciation rates.

The Company recommends that this surplus be spread over the ARL of the account through the use of the proposed remaining life depreciation rates. The difference between an ASL depreciation rate and an ARL depreciation rate is the systematic allocation of the actual to theoretical reserve difference over the ARL of the asset. A surplus lowers the ASL depreciation rate and a deficit increases the ASL depreciation rate. To demonstrate the effect of switching from an ASL depreciation rate to an ARL depreciation rate (where both were based on the proposed changes in life and net salvage rates), the difference in annual depreciation expense is an increase of $\$ 1.3$ million for electric utility, a decrease of $\$ 4.3$ million for gas utility, an increase of $\$ 0.5$ million for common utility. These differences are shown in Schedule J.

## 5. Reallocation of Reserves within Functional Class

In addition to the inclusion of the amortization of reserve differences over the remaining life factored into the change from an ASL rate to an ARL rate, the Company recommends a reallocation of the depreciation reserve within each functional class. Based on the theoretical reserve by FERC account within a functional class, the Company directed the Alliance Consulting Group to reallocate the actual reserve total for each functional class. The reallocation does not change the
overall actual to theoretical reserve difference for a functional class; it just redistributes it more equitably among the FERC accounts within a functional class. A reallocation rebalances the actual reserve where one account is in surplus and another is in deficit. The reserve reallocation is determined by calculating a factor by dividing the actual reserve as of January 1, 2017 for a functional class by the total theoretical reserve for that functional class. This factor was then applied to theoretical reserve by FERC account to realign the actual reserve within the functional class. The proposed reallocation of the actual reserve is shown in Schedule H.

## D. Attached Schedules

The following schedules have been included for satisfaction of filing requirements and for additional support to the recommended changes; Schedules E, F, and G have been included in compliance with Minn. R. 7825.0700:

| Schedule |  |
| :--- | :--- |
| A | Proposed Depreciation Lives, and Rates |
| B | Comparison of Present and Proposed Depreciation Lives and Rates |
| C | Comparison of Present and Proposed Depreciation Expense |
| D | Depreciation Study by Alliance Consulting Group |
| E | Plant In-service |
| F | Accumulated Depreciation |
| G | Annual Depreciation Accrual Determination |
| H | Reserve Reallocation |
| I | Theoretical Reserve Adjustment from Prior Rate Proceedings |
| J | Comparison of Proposed ARL to ASL |
| K | Accumulated Depreciation Linkage between Schedules |

## E. Proposal for Future ARL Filings

This filing is being submitted under Minn. R. 7825.0700, which requires the Company to file a petition for depreciation certification every five years. Historically, the Commission's five-year depreciation certification order would be effective as of January 1 immediately following the certification of the petition. For example, the depreciation rates certified in the Company's 2012 five-year depreciation petition (filed in July 2012) were made effective January 1, 2013. Similarly, the Company is proposing that the revised depreciation rates and net salvage rates and the change to an ARL method be effective January 1, 2018.

In contrast, pursuant to Minn. R. 7825.0600, the Company submits an annual remaining lives filing (usually in February to be effective the prior January 1). The
purpose of these annual reviews is to reflect any changes in remaining lives that occur between the five-year studies.

By changing to an ARL method for transmission, distribution, and general plant for electric, gas, and common utilities, the Company anticipates the need for a separate annual remaining lives petition to adjust as necessary the ARL rates for these nonproduction assets. The Company proposes that these studies be submitted annually on approximately July 31 (with the first filing being made on July 31, 2018 with rates effective January 1, 2019). The Company would continue to file a comprehensive depreciation certification study every five years, as required by Minn. R. 7825.0700. For example, the next five-year study would be filed by July 31, 2022.

The Company believes this proposed process would be consistent with the Commission's requirements for five-year certification petitions and annual remaining lives petitions.

## VI. EFFECT OF THE CHANGE IN RATES

Approval of this Petition will have no effect on Xcel Energy's 2017 revenue, since the changes are proposed to be effective January 1, 2018. The net impact on annual depreciation expense for the new proposed rates in 2018 will be an approximate decrease in depreciation expense of $\$ 6.9$ million. However, the electric utility change after common allocation is the estimated amount that will be reflected in the capital trueup. To the extent that the Commission approves the decrease for the gas utility, the Company will work with parties on how to address this decrease in future rate proceedings.

## Conclusion

The Petition proposes changes in the average service lives and net salvage rates that better reflect actual operating expectations and environmental requirements. The Petition also requests to incorporate use of the ARL methodology, allowing an automatic true-up of differences between the theoretical and actual reserve margins over the remaining lives of the assets. Each of these changes is reasonable and consistent with the public interest. The Company requests the effective date for this change to be January 1, 2018.

In The Matter of the Petition of
Docket No. E,G002/D-17- $\qquad$ Northern States Power Company for Certification of its Five-Year

Petition Transmission, Distribution, and General Depreciation Study

## Summary of Filing

Please take notice that on July 31, 2017, Northern States Power Company, doing business as Xcel Energy, filed with the Minnesota Public Utilities Commission a Petition requesting approval of its proposed changes to depreciation lives and rates for Transmission, Distribution, and General Plant. The proposed changes include life extensions and reductions as well as higher removal costs and higher salvage for several assets. The Petition also requests a change from the use of an average service life methodology to an average remaining life methodology, with amortization of depreciation reserves. In the aggregate, these changes reduce the Company's present depreciation costs by approximately $\$ 6.9$ million. The changes are proposed to be effective January 1, 2018.

(1): Plant Balance for vintage group (amortized) assets is for the vintages as of $1 / 1 / 2017$ that are not fully depreciated.
(2): This account is fully depreciated as of $1 / 1 / 2017$.
(3): Vintage Group accounts do not have an Iowa Curve assigned.
(4): As of $1 / 1 / 2017$ there was zero plant balance in this FERC Account. It is included in proposed rates using the same factors as the electric segment for possible future use.

(1): Plant balance for vintage group (amortized) assets is for the vintages as of $1 / 1 / 2017$ that are not fully depreciated
(2): This account is fully depreciated.
(3): Vintage group accounts do not have an Iowa Curve assigned.
(4): As of $1 / 1 / 2017$ there was zero plant balance in this FERC Account. It is included in proposed rates using the same factors as the electric segment for possible future use.
(5): This rate is being proposed in this docket. It is included here for comparative purposes.

# NORTHERN STATES POWER COMPANY A MINNESOTA CORPORATION TRANSMISSION, DISTRIBUTION AND GENERAL ELECTRIC, GAS AND COMMON DEPRECIATION RATE STUDY <br> July 2017 

$\qquad$

# NORTHERN STATES POWER COMPANY <br> A MINNESOTA CORPORATION TRANSMISSION, DISTRIBUTION AND GENERAL ELECTRIC, GAS AND COMMON DEPRECIATION RATE STUDY EXECUTIVE SUMMARY 

Northern States Power Company, a Minnesota corporation ("NSP" or "Company"), engaged Alliance Consulting Group to conduct a depreciation study of the Company's Electric, Gas, and Common transmission, distribution, and general utility plant depreciable assets as of January 1, 2017. This analysis recommends a number of changes in the lives of various types of assets, by account number under the FERC Uniform System of Accounts. The changes in lives discussed in this Executive Summary are discussed in more detail in the study.

For Electric Transmission, Distribution and General Plant depreciable accounts, the lives for many of the accounts increased. There are 18 accounts, nine that have increasing lives, three that have decreasing lives, and the lives of the other six accounts were unchanged. The account with the greatest change in life is account 354 Transmission Towers and Fixtures which moved 5 years longer in life. There is also a trend toward higher negative net salvage with 12 accounts increasing (i.e. more negative) their negative net salvage and the remaining six accounts remaining unchanged. The account with the largest increase in negative net salvage is Account 364 Distribution Poles, where the net salvage moved from negative 100 percent to a negative 120 percent, which equates to a change of 20 percent.

For Electric Amortized Plant, there are 20 accounts including one intangible account, 15 general plant accounts, and four distribution accounts. Most amortization periods are remaining the same, with amortization lives increasing for Account 391 Network Equipment, Account 397 General Communication Equipment, and Account 397 General Two Way and decreasing lives for Accounts 392
$\qquad$

Transportation Equipment for Light Trucks, Trailers, and Heavy Trucks. Net salvage increased (became more negative) for three accounts: Account 368 Distribution Line Capacitors, Account 370.1 Distribution Meters-Old and Account 370 Distribution Meters. Net salvage became positive in Accounts 392 (all subaccounts) and 396. The largest change was in Account 392 General Trailers changing from zero percent to positive 20 percent for net salvage.

For Gas Transmission, Distribution and General Plant depreciable accounts, there are 11 accounts including six that have increasing lives and five accounts that were unchanged. The accounts with the greatest change in life were Account 366 Transmission Structures and Improvements and Account 376 Distribution MainsMetallic which moved 13 and 12 years longer in life respectively. There are changes in net salvage with four accounts increasing (i.e. more negative) their negative net salvage, two accounts decreasing (i.e. less negative) their negative net salvage, and the remaining five accounts remaining unchanged. The accounts with the greatest change in net salvage were Account 375 Distribution Structures and Improvements, Account 376 Distribution Mains-Metallic, and Account 376 Distribution Mains-Plastic that all increased by five percent.

For Gas Amortized Plant, there are 19 accounts including two intangible accounts, 14 general plant accounts, and three distribution accounts. Most amortization periods remain the same, and amortization periods increase for Account 391 General Network Equipment, Account 397 General Communication Equipment, and Account 397 General Two Way and decreasing lives for Accounts 392 Transportation Equipment for Light Trucks, Trailers, and Heavy Trucks. Net salvage increased (more negative) for two accounts: Account 381 Distribution Meters and Account 383 Distribution House Regulators. Net salvage became positive in Accounts 392 (all subaccounts) and 396. The largest change was in Account 392 General Trailers changing from zero percent to positive 20 percent for net salvage.

For Common Plant, there are 20 accounts including two depreciable accounts and 18 amortized accounts of which there are five intangible accounts and 13
$\qquad$
general plant accounts. The life for Account 390 Structures and Improvements became shorter, and many amortization periods remain the same. Amortization periods increased for Account 391 General Network Equipment, Account 397 General Communication Equipment, and Account 397 General Two Way and decreased for Accounts 392 Transportation Equipment for Light Trucks, Trailers, and Heavy Trucks. Net salvage became positive in Accounts 392 (all subaccounts) and Account 396 Power Operated Equipment. The largest change was in Account 392 Transportation Equipment for Trailers changing from zero percent to positive 20 percent for net salvage. Amortization rates were updated to reflect any imbalance between book and theoretical reserves.

For life and net salvage analysis, the study used total Company results. After selecting life and net salvage parameters, those depreciation parameters were applied to the total Company plant using the Minnesota approved depreciation rates to provide the reserve balances for transmission and general plant. Plant balances for Minnesota state-specific assets and their reserve balances using the Minnesota approved depreciation rates were used for Electric and Gas Distribution plant.

All annual accrual rates were determined using the straight line, broad group, remaining life depreciation system. Depreciation and amortization rates reflect any imbalance between actual and theoretical reserves. Use of the remaining life depreciation system adds a self-correcting mechanism, which accounts for any differences between theoretical and book depreciation reserve over the remaining life of each depreciable group.

Given the many changes in life and net salvage in this study, this study recommends a reallocation of book reserve by plant account within each function. This reallocation does not change the total reserve within each function. Rather, reallocating the reserve within a function realigns the depreciation reserve balances within each function using the proposed life and net salvage parameters.

This study recommends an overall decrease of approximately $\$ 7.4$ million in annual depreciation expense compared to the depreciation rates currently in effect after implementing the Minnesota Public Utilities Commission order in Docket No.

E,G002/D-12-858. This consists of an increase of $\$ 3.7$ million in annual depreciation expense for Electric facilities, a decrease of $\$ 7.1$ million in annual depreciation expense for Gas facilities compared to the depreciation rates currently in effect, and a decrease of approximately $\$ 4.0$ million for Common plant in annual depreciation expense. The overall decrease in depreciation expense is driven by changes in life and net salvage as well as treatment of any book and theoretical reserve imbalance. Appendix $B$ demonstrates the change in depreciation expense for the various accounts. If approved by the Commission, the changes recommended in the study would be used by the Company effective January 1, 2018.

## PURPOSE

The purpose of this study is to develop depreciation rates for the period beginning January 1, 2018 for the depreciable property as recorded on the books of Northern States Power Company, a Minnesota corporation ("NSP" or "Company"), at January 1, 2017. The account based depreciation rates were designed to recover the total remaining undepreciated investment, adjusted for net salvage, over the remaining life of NSP's property on a straight-line basis. Non-depreciable property and production plant were excluded from this study.

## STUDY RESULTS

Overall depreciation rates for all NSP depreciable property are shown in Appendix A. These rates translate into an annual depreciation accrual of \$303.7 million based on NSP depreciable investment at January 1, 2017. The annual equivalent depreciation expense calculated by the same method using the approved rates was $\$ 310.6$ million. These proposed rates translate into an annual depreciation accrual for Electric of $\$ 220.5$ million, Gas of $\$ 27.4$ million, and Common of $\$ 55.8$ million. Appendix A demonstrates the development of the annual depreciation rates and accruals by account. Appendix B presents a comparison of approved rates versus proposed rates by account. Appendix $C$ presents a summary of mortality and net salvage estimates by account. Appendix D presents a comparison between theoretical and book accumulated depreciation reserves for each account. Appendix E presents the net salvage analysis for all accounts. The overall decrease in depreciation expense is driven by changes in life and net salvage as well as treatment of any book and theoretical reserve imbalance. Shown below is a summary of the results for each group and function:

| Type of Plant (in millions) | Accrual at Existing Rates | Accrual at <br> Proposed <br> Rates | Difference |
| :---: | :---: | :---: | :---: |
| Electric Transmission Depreciable | \$67.9 | \$72.4 | \$4.5 |
| Electric Distribution Depreciable | \$77.9 | \$80.2 | \$2.3 |
| Electric General Depreciable | \$1.4 | \$1.5 | \$0.1 |
| Electric Distribution Amortized | \$16.5 | \$16.4 | (\$0.1) |
| Electric General \& Intangible Amortized | \$53.1 | \$50.0 | (\$3.1) |
| Gas Transmission | \$1.6 | \$1.2 | (\$0.4) |
| Gas Distribution Depreciated | \$23.3 | \$19.1 | (\$4.2) |
| Gas Distribution Amortized | \$4.8 | \$4.0 | (\$0.8) |
| Gas General Depreciated | \$0.03 | \$0.04 | (\$0.0) |
| Gas General \& Intangible Amortized | \$4.3 | \$3.1 | (\$1.2) |
| Common Depreciated | \$5.2 | \$5.8 | \$0.6 |
| Common Amortized | \$54.6 | \$50.0 | (\$4.6) |
| Total | \$310.6 | \$303.7 | (\$6.9) |

$\qquad$

## GENERAL DISCUSSION

## Definition

The term "depreciation" as used in this study is considered in the accounting sense, that is, a system of accounting that distributes the cost of assets, less net salvage (if any), over the estimated useful life of the assets in a systematic and rational manner. It is a process of allocation, not valuation. This expense is systematically allocated to accounting periods over the life of the properties. The amount allocated to any one accounting period does not necessarily represent the loss or decrease in value that will occur during that particular period. The Company accrues depreciation on the basis of the original cost of all depreciable property included in each functional property group. On retirement, the full cost of depreciable property, less the net salvage value (which may be negative), is charged to the depreciation reserve.

## Basis of Depreciation Estimates

The straight-line, broad (average) life group, remaining-life depreciation system was employed to calculate annual and accrued depreciation in this study. In this system, the annual depreciation expense for each group is computed by dividing the original cost of the asset less allocated depreciation reserve less estimated net salvage by its respective average life group remaining life. The resulting annual accrual amounts of all depreciable property within a function were accumulated, and the total was divided by the original cost of all functional depreciable property to determine the depreciation rate. The calculated remaining lives and annual depreciation accrual rates were based on attained ages of plant in service and the estimated service life and salvage characteristics of each depreciable group. The computations of the annual functional depreciation rates are shown in Appendix A.

Actuarial analysis was used with each account within a function where sufficient data was available, and judgment was used to some degree on all accounts.
$\qquad$

## Survivor Curves

To fully understand depreciation projections in a regulated utility setting, there must be a basic understanding of survivor curves. Individual property units within a group (for example, wood distribution poles) do not normally have identical lives or investment amounts. The average life of a group can be determined by first constructing a survivor curve which is plotted as a percentage of the units surviving at each age. A survivor curve represents the percentage of property remaining in service at various age intervals. The Iowa Survivor Curves ("lowa Curves") are the result of an extensive investigation of life characteristics of physical property made at lowa State College Engineering Experiment Station in the first half of the prior century. Through common usage, revalidation and regulatory acceptance, these curves have become a descriptive standard for the life characteristics of industrial property. An example of an Iowa Curve is shown below.

$\qquad$

There are four families in the lowa Curves that are distinguished by the relation of the age at the retirement mode (largest annual retirement frequency) and the average life. For distributions with the mode age greater than the average life, an "R" designation (i.e., Right modal) is used. The family of " $R$ " moded curves is shown below.

Similarly, an "S" designation (i.e., Symmetric modal) is used for the family whose mode age is symmetric about the average life. An "L" designation (i.e., Left modal) is used for the curve family whose mode age is less than the average life. A special case of left modal dispersion is the "O" or origin modal curve family. Within each curve family, numerical designations are used to describe the relative magnitude of the retirement frequencies at the mode. A " 6 " indicates that the retirements are not greatly dispersed from the mode (i.e., high mode frequency) while a " 1 " indicates a large dispersion about the mode (i.e., low mode frequency). For example, a curve with an
$\qquad$
average life of 30 years and an "L3" dispersion is a moderately dispersed, left modal curve that can be designated as a 30 L3 Curve. A SQ, or square, survivor curve occurs where no dispersion is present (i.e., units of common age retire simultaneously).

Most property groups can be closely fitted to one lowa Curve with a unique average service life. The blending of judgment concerning current conditions and future trends along with the matching of historical data permits the depreciation analyst to make an informed selection of an account's average life and retirement dispersion pattern.

## Actuarial Analysis

Actuarial analysis (retirement rate method) was used in evaluating historical asset retirement experience where vintage data were available and sufficient retirement activity was present. In actuarial analysis, interval exposures (total property subject to retirement at the beginning of the age interval, regardless of vintage) and age interval retirements are calculated. The complement of the ratio of interval retirements to interval exposures establishes a survivor ratio. The survivor ratio is the fraction of property surviving to the end of the selected age interval, given that it has survived to the beginning of that age interval. Survivor ratios for all of the available age intervals were chained by successive multiplications to establish a series of survivor factors, collectively known as an observed life table. The observed life table shows the experienced mortality characteristic of the account and may be compared to standard mortality curves such as the Iowa Curves. Where data was available, accounts were analyzed using this method. Placement bands were used to illustrate the composite history over a specific era, and experience bands were used to focus on retirement history for all vintages during a set period. The results from these analyses for those accounts which had data sufficient to be analyzed using this method are shown in the Life Analysis section of this report.
$\qquad$

## Simulated Plant Record Procedure

The Simulated Plant Record Procedure - Balances approach ("SPR") is one of the commonly accepted approaches to analyze mortality characteristics of utility property. SPR was applied to some of the Electric and Gas Distribution accounts due to the unavailability of vintaged transactional data. In this method, an lowa Curve and average service life are selected as a starting point of the analysis and its survivor factors are applied to the actual annual additions to give a sequence of annual balance totals. These simulated balances are compared with the actual balances by using both graphical and statistical analysis. Through multiple comparisons, the mortality characteristics (as defined by an average life and lowa Curve) that are the best match to the property in the account can be found.

The Conformance Index ("Cl") is one measure used to evaluate various SPR analyses. Cls are also used to evaluate the "goodness of fit" between the actual data and the lowa Curve being referenced. The sum of squares difference ("SSD") is a summation of the difference between the calculated balances and the actual balances for the band or test year being analyzed. This difference is squared and then summed to arrive at the SSD, where n is the number of years in the test band as follows:

$$
S S D=\Sigma_{1}^{n}\left(\text { Calculated Balance }_{i}-\text { Observed Balance }{ }_{i}\right)^{2}
$$

This calculation can then be used to develop other calculations, which the analyst feels might give a better indication for the "goodness of fit" for the representative curve under consideration. The residual measure ("RM") is the square root of the average squared differences as developed above. The residual measure is calculated as follows:

$$
\left.R M=\sqrt{( } \frac{S S D}{n}\right)
$$

The Cl is developed from the residual measure and the average observed plant balances for the band or test year being analyzed. The calculation of conformance index is shown below:

$$
C I=\frac{\sum_{1}^{n} \text { Balances }_{i} / n}{R M}
$$

The Retirement Experience Index ("REl") gives an indication of the maturity of the account and is the percent of the property retired from the oldest vintage in the band at the end of the test year. Retirement indices range from 0 percent to 100 percent and a REI of 100 percent indicates that a complete curve was used. A REI less than 100 percent indicates that the survivor curve was truncated at that point. The originator of the SPR method, Alex Bauhan, suggests ranges of value for the Cl and REI. The relationship for Cl proposed by Bauhan is shown below ${ }^{1}$ :

| CI | Value |
| :--- | :--- |
| Over 75 | Excellent |
| 50 to 75 | Good |
| 25 to 50 | Fair |
| Under 25 | Poor |

$\qquad$

The relationship for REI proposed by Bauhan ${ }^{2}$ is shown below:

| REI | Value |
| :--- | :--- |
| Over 75 | Excellent |
| 50 to 75 | Good |
| 33 to 50 | Fair |
| 17 to 33 | Poor |
| 17 and below | Valueless |

Depreciation analysts have used these measures in analyzing SPR results for nearly 60 years, since the SPR method was developed. Both the CI and REI statistics provide the analyst with important information with which to make a comparison between a band of simulated or calculated balances and the observed or actual balances in the account being studied.

Statistics are useful in analyzing mortality characteristics of accounts, as well as determining a range of service lives to be analyzed using the detailed graphical method. However, these statistics boil all the information down to one, or at most, a few numbers for comparison. Visual matching through comparison between actual and calculated balances expands the analysis by permitting the analyst to view many points of data at a time. The goodness of fit should be visually compared to plots of other lowa Curve dispersions and average lives for the selection of the appropriate curve and life. Detailed information for each account is shown later in this study and in workpapers.

## Judgment

Any depreciation study requires informed judgment by the analyst conducting the study. A knowledge of the property being studied, company policies and procedures, general trends in technology and industry practice, and a sound basis of understanding depreciation theory are needed to apply this informed judgment. Judgment was used in areas such as survivor curve modeling and selection, depreciation method selection, simulated plant record method analysis, and actuarial analysis.

2 Public Utility Depreciation Practices, p. 97.
$\qquad$

Judgment is not defined as being used in cases where there are specific, significant pieces of information that influence the choice of a life or curve. Those cases would simply be a reflection of specific facts into the analysis. Where there are multiple factors, activities, actions, property characteristics, statistical inconsistencies, implications of applying certain curves, property mix in accounts or a multitude of other considerations that impact the analysis (potentially in various directions), judgment is used to take all of these factors and synthesize them into a general direction or understanding of the characteristics of the property. Individually, no one factor in these cases may have a substantial impact on the analysis, but overall, may shed light on the utilization and characteristics of assets. Judgment may also be defined as deduction, inference, wisdom, common sense, or the ability to make sensible decisions. There is no single correct result from statistical analysis; hence, there is no answer absent judgment. At the very least for example, any analysis requires choosing the bands on which to place more emphasis.

The establishment of appropriate average service lives and retirement dispersions for the Transmission, Distribution, and General Plant accounts for the Electric, Gas, and Common utilities requires judgment to incorporate the understanding of the operation of the system with the available accounting information analyzed using the Retirement Rate actuarial methods. The appropriateness of lives and curves depends not only on statistical analyses, but also on how well future retirement patterns will match past retirements.

Current applications and trends in use of the equipment also need to be factored into life and survivor curve choices in order for appropriate mortality characteristics to be chosen.

## Average Life Group Depreciation

The Commission has approved NSP's use the average life group ("ALG") depreciation procedure in various proceedings. At the request of the Company, this study continues to use the ALG depreciation procedure to group the assets within each account. After average service life and a dispersion curve were selected for each account, those parameters were used to estimate what portion of the surviving
investment of each vintage was expected to retire. The depreciation of the group continues until all investment in the vintage group is retired. ALG is defined by their respective account dispersion curve, life, and salvage estimates. A straight-line rate for each ALG is calculated by computing a composite remaining life for each group across all vintages within the group, dividing the remaining investment to be recovered by the remaining life to find the annual depreciation expense and dividing the annual depreciation expense by the surviving investment. The resultant rate for each ALG group is designed to recover all retirements less net salvage when the last unit retires. The ALG procedure recovers net book cost over the life of each account by averaging many components.
$\qquad$

## Theoretical Depreciation Reserve

The book depreciation reserve was derived from Company records and was reallocated from a functional level to individual accounts. This study used a reserve model that relied on a prospective concept relating future retirement and accrual patterns for property, given current life and salvage estimates. The theoretical reserve of a group is developed from the estimated remaining life, total life of the property group, and estimated net salvage. The theoretical reserve represents the portion of the group cost that would have been accrued if current forecasts were used throughout the life of the group for future depreciation accruals. The computation involves multiplying the vintage balances within the group by the theoretical reserve ratio for each vintage. The average life group method requires an estimate of dispersion and service life to establish how much of each vintage is expected to be retired in each year until all property within the group is retired. Estimated average service lives and dispersion determine the amount within each average life group. The straight-line remaining-life theoretical reserve ratio ("RR") at any given age is calculated as:

$$
\mathrm{RR}=1-\frac{(\text { AverageRemaining Life })}{(\text { AverageService Life) }} *(1-\text { Net Salvage Ratio })
$$

The use of the remaining life method effectively spreads any actual to theoretical reserve variance over the expected remaining life of the account.

## Change to Average Life Group Remaining life Depreciation System

In the Company's 2013 and 2014 electric rate cases (Docket Nos. E002/GR-12-961 and E002/GR-13-868 respectively) there was significant attention given to the difference in the theoretical and actual reserves. To address that concern, the Company recommended in the 2013 electric rate case that the net book value be recovered over the remaining life of each Electric and Common account. The issue was resolved by spreading the theoretical surplus over periods much shorter than
the remaining lives. In the Company's last depreciation study, Docket No. E,G002/D-12-858 (5-year depreciation study), the remaining life depreciation system was proposed to address those concerns but was not adopted because of the treatment afforded to the theoretical surplus in the 2012 and 2013 electric rate cases. This 2017 study again recommends use of the remaining life depreciation system. Use of the remaining life depreciation system adds a self-correcting mechanism, which accounts for any differences between theoretical and book depreciation reserve over the remaining life of each depreciable group. Use of remaining life ensures that the difference between book and theoretical reserve will be amortized ratably over the remaining life of the group.
$\qquad$

## DETAILED DISCUSSION

## Depreciation Study Process

This depreciation study encompassed four distinct phases. The first phase involved data collection and field interviews. The second phase was where the initial data analysis occurred. The third phase was where the information and analysis was evaluated. Once the first three stages were complete, the fourth phase began. This phase involved the calculation of deprecation rates and documenting the corresponding recommendations.

During the Phase I data collection process, historical data was compiled from continuing property records and general ledger systems. Data was validated for accuracy by extracting and comparing to multiple financial system sources. Audit of this data was validated against historical data from prior periods, historical general ledger sources, and field personnel discussions. This data was reviewed extensively to put in the proper format for a depreciation study. Further discussion on data review and adjustment is found in the Salvage Considerations Section of this study. Also as part of the Phase I data collection process, numerous discussions were conducted with engineers and field operations personnel to obtain information that would assist in formulating life and salvage recommendations in this study. One of the most important elements of performing a proper depreciation study is to understand how the Company utilizes assets and the environment of those assets. Interviews with engineering and operations personnel are important ways to allow the analyst to obtain information that is beneficial when evaluating the output from the life and net salvage programs in relation to the Company's actual asset utilization and environment. Information that was gleaned in these discussions is found both in the Detailed Discussion of this study in the life analysis and salvage analysis sections and also in workpapers.

Phase 2 is where the actuarial analysis is performed. Phase 2 and 3 overlap to a significant degree. The detailed property records information is used in phase 2 to develop observed life tables for life analysis. These tables are visually compared to industry standard tables to determine historical life characteristics. It is possible
$\qquad$
that the analyst would cycle back to this phase based on the evaluation process performed in Phase 3. Net salvage analysis consists of compiling historical salvage and removal data by functional group to determine values and trends in gross salvage and removal cost. This information was then carried forward into Phase 3 for the evaluation process.

Phase 3 is the evaluation process which synthesizes analysis, interviews, and operational characteristics into a final selection of asset lives and net salvage parameters. The historical analysis from Phase 2 is further enhanced by the incorporation of recent or future changes in the characteristics or operations of assets that were revealed in Phase 1. Phases 2 and 3 allow the depreciation analyst to validate the asset characteristics as seen in the accounting transactions with actual Company operational experience.

Finally, Phase 4 involved the calculation of accrual rates, making recommendations and documenting the conclusions in a final report. The calculation of accrual rates is found in Appendix A. Recommendations for the various accounts are contained within the Detailed Discussion of this report. The depreciation study flow diagram shown as Figure $1^{3}$ documents the steps used in conducting this study. Depreciation Systems, page 289 documents the same basic processes in performing a depreciation study which are: Statistical analysis, evaluation of statistical analysis, discussions with management, forecast assumptions, write logic supporting forecasts and estimation, and write final report.

[^1]$\qquad$

## Book Depreciation Study Flow Diagram

*Although not specifically noted, the mathematical
Source: Introduction to Depreciation for
Public Utilities and Other Industries, AGA analysis may need some level of input from other sources (for example, to determine analysis bands for life and adjustments to data used in all analysis).

Figure 1
$\qquad$

## Depreciation Rate Calculation

Annual depreciation expense amounts for the depreciable accounts of NSP were calculated by the straight-line method, average life group procedure, and remaining-life technique. With this approach, remaining lives were calculated according to standard ALG expectancy techniques, using the lowa Curves noted in the calculation. For each plant account under the FERC Uniform System of Accounts, the difference between the surviving investment, adjusted for estimated net salvage, and the allocated book depreciation reserve, was divided by the average remaining life to yield the annual depreciation expense. These calculations are shown in Appendix A.

## Remaining Life Calculation

The establishment of appropriate average service lives and retirement dispersions for each account within a functional group was based on engineering judgment that incorporated available accounting information analyzed using the Retirement Rate actuarial methods. After establishing the appropriate average service lives and retirement dispersion, the remaining life was computed for each account. The theoretical depreciation reserve with zero net salvage was calculated using theoretical reserve ratios as defined in the theoretical reserve portion of the General Discussion section. The difference between book depreciation reserve and theoretical reserve was then spread over the remaining life by ALG. Remaining life computations are found for each account in workpapers.
$\qquad$

## Calculation Process

Annual depreciation expense amounts for all accounts were calculated by the straight line, remaining life procedure.

In a whole life representation, the annual accrual rate is computed by the following equation,

Annual Accrual Rate $=\frac{(100 \%-\text { Net Salvage Percent })}{\text { Average Service Life }}$
Use of the remaining life depreciation system adds a self-correcting mechanism, which accounts for any differences between theoretical and book depreciation reserve over the remaining life of the group. With the straight line, remaining life, average life group system using lowa Curves, composite remaining lives were calculated according to standard broad group expectancy techniques, noted in the formula below:
Composite Remaining Life $=\frac{\sum \text { Original Cost }- \text { Theoretical Reserve }}{\sum \text { Whole Life Annual Accrual }}$
For each plant account, the difference between the surviving investment, adjusted for estimated net salvage, and the allocated book depreciation reserve, was divided by the composite remaining life to yield the annual depreciation expense as noted in this equation where the Net Salvage\% represents future net salvage.
Annual Depreciation Expense $=\frac{\text { Original Cost }- \text { Book Reserve }-(\text { Original Cost }) *(1-\text { Net Salvage \%) })}{\text { Composite Remaining Life }}$

Within a group, the sum of the group annual depreciation expense amounts, as a percentage of the depreciable original cost investment summed, gives the annual depreciation rate as shown below:
Annual Depreciation Rate $=\frac{\sum \text { Annual Depreciation Expense }}{\sum \text { Original Cost }}$
$\qquad$

These calculations are shown in Appendix A. The calculations of the theoretical depreciation reserve values and the corresponding remaining life calculations are shown in workpapers. Book depreciation reserves were allocated from a functional level to individual accounts and the theoretical reserve computation was used to compute a composite remaining life for each account. A comparison between theoretical reserve and the reallocated book reserve is shown in Appendix D for all accounts.

## Life Analysis

The retirement rate actuarial analysis method was applied to accounts which had sufficient aged data for Northern States Power Company - Minnesota. Some of the mass distribution accounts only had aged retirement data from transaction year 2001 forward. Those accounts were analyzed with the SPR balances method. The distribution accounts analyzed with SPR were: Electric 364 Poles, Towers \& Fixtures, 365 Overhead Conductor \& Devices, 366 - Underground Conduit, 367 Underground Conductor and Devices, 369 Services - Overhead, 369 Services Underground, 373 Street Lighting \& Signal Systems, and Gas: 376 Mains - Metallic, 376 Mains - Plastic, 380 Services - Metallic, and 380 Services - Plastic. For each account with sufficient data, an actuarial retirement rate analysis was made with placement and experience bands of varying width. The historical observed life table was plotted and compared with various lowa Curves to obtain the most appropriate match. A selected curve for each account is shown in the Life Analysis Section of this report. The observed life tables for all analyzed placement and experience bands are provided in workpapers.

For each account on the overall band (i.e. placement from earliest vintage year which varied for each account through 2016), approved survivor curves from MPUC Docket No. E,G002/D-12-858, modified by subsequent orders if applicable, were used as a starting point. Then using the same average life, various dispersion curves were plotted. Frequently, visual matching would confirm one specific dispersion pattern (i.e. L, S. or R) as an obviously better match than others. The next step would be to determine the most appropriate life using that dispersion
pattern. Then, after looking at the overall experience band, different experience bands were plotted and analyzed: in increments of approximately 20 years, for instance 1967-2016, 1987-2016, etc. Next, placement bands of varying width were plotted with each experience band discussed above. Repeated matching usually pointed to a focus on one dispersion family and small range of service lives. The goal of visual matching was to minimize the differential between the observed life table and lowa curve in top and mid range of the plots. These results are used in conjunction with all other factors that may influence asset lives.

For account(s) which had insufficient data for actuarial analysis, a simulated plant record method analysis was performed at intervals for the overall band and at 10 year intervals within the overall balance period. In addition to reviewing the SPR analysis for each band and account, a graphical comparison between actual and simulated balances was performed.

These results are used in conjunction with all other factors that may influence asset lives.
$\qquad$

## ELECTRIC PLANT

## TRANSMISSION

## Transmission Accounts, FERC Accounts 352-358

## FERC Account 352 Transmission Structures \& Improvements (proposed 70 year life with a R5 dispersion curve)

This account includes buildings, fencing and other structures found in a transmission substation. The current investment balance is $\$ 103.1$ million. The approved life and curve is 68 years with a R5 dispersion curve. There is a limited amount of data for actuarial analysis. Narrow bands do not have sufficient data with curves that stop at 97 percent are higher. For the overall band, a longer life greatly in excess of the current 45 year life is indicated. Company personnel anticipate a longer life than approved, in the range of 65 to 70 years. Frost and severe winter conditions are factors that can contribute to retirements in Minnesota. Based on judgment and Company experience, a 70 year life is proposed for this account while retaining the R5 dispersion curve.

$\qquad$

## FERC Account 353 Transmission Station Equipment (proposed 56 year life with a R2 dispersion curve)

This account contains a wide variety of transmission substation equipment, from circuit breakers to switchgear. The current investment balance is $\$ 1.2$ billion. The current approved life is 56 years with a R2 dispersion curve. The Company maintains a table of low, normal, and long expectations for the various assets types in this account. Company personnel believe the middle or normal estimate is the most reflective of the Company assets. Relays are transitioning from electromechanical and solid state to microprocessor relays with an estimated life of 30 years. Company personnel expect to replace all older relays in the next 8-10 years. Life analysis across a variety of bands shows a longer life, in the 50 year and over range. Based on actuarial experience and judgment regarding the asset groups in this account, this study recommends retaining a 56 -year life with an R2 dispersion curve for this account.

$\qquad$

## FERC Account 354 Transmission Towers \& Fixtures (proposed 75 year life with a R4 dispersion curve)

This account consists of Transmission towers and fixtures, which are used to transmit electricity at a voltage of 69 kV and above. The current investment balance is $\$ 118.6$ million. The current approved life is the 70 years with a R4 dispersion curve. There has been a smaller amount of retirements occurring for towers versus other transmission accounts. Some towers are beginning to exhibit corrosion. Based on Company experience and judgment, this study recommends moving to a 75 year life with a R4 dispersion curve for this account.

$\qquad$

## FERC Account 355 Transmission Poles \& Fixtures (proposed 62 year life with a R2 dispersion curve)

This account consists of Transmission poles and fixtures, which are used to transmit electricity at a voltage of 69 kV and above. The current investment balance is $\$ 1.3$ billion. The current approved life is 62 years with a R2 dispersion curve. Company personnel expect that 100 percent of all structures will have been retired by the age of 75 years, and perhaps 80 percent will last past 50 years. A small percentage will retire in the first 25 years. By 75 years, structures will have degraded to the point that they will all have to be replaced. Rot, obsolescence, change in energy flow, and new capacity are all potential causes of retirement. Based on the best fitting curves for the majority of the placement and experience band combinations, retaining a life of 62 years with a R2 dispersion curve is recommended for this account.

## FERC Account 356 Transmission Overhead Conductor \& Devices (proposed 67 year life with a R1 dispersion curve)

This account consists of Transmission overhead conductors, which are used to transmit electricity at voltages of 69 kV and above. The current investment balance is $\$ 532.7$ million. The current approved life is 63 years with a R1 dispersion curve. Company personnel anticipate that conductor will have a life similar to poles in Account 355. Conductor may be replaced when it is too small or exhibits problems such as corrosion, falling splices, storms, or sag issues. Glass insulators are being replaced on dead ends and polymer on tangents. Polymer insulators are expected to last 30 years and be replaced once over the life of the line. Based on the actuarial analysis, life indications are moving to a longer life, as noted by Company personnel. This study recommends a life of 67 years with a R1 dispersion curve for this account.

$\qquad$

## FERC Account 357 Transmission Underground Conduit (proposed 73 year life with a R4 dispersion curve)

This account consists of underground conduit. The current investment balance is $\$ 25.9$ million. The current approved life is 73 years with a R 4 dispersion curve. Retirement data is limited for this account. Company personnel believe the current life for conduit is reasonable and recommend a life around 70 years. Based on actuarial analysis and input from Company personnel, this study recommends retaining a life of 73 years with a R4 dispersion curve for this account.

## FERC Account 358 Transmission Underground Conductor \& Devices (proposed 50 year with a R3 dispersion curve)

This account consists of underground conductor. The lines are low pressure oil filled; paper wrapped 500 MCM (thousands of circular mills, wire gauge measurement) copper cable. The current investment balance is $\$ 30.7$ million. The current approved life is 55 years with a R2 dispersion curve. Company personnel indicate overall a life of 50 years for underground conductor is a reasonable expectation. Most conductor is HPFF (high pressure fluid filled) which the manufacturer will not make in the future and will have to be replaced with XPLE (solid dielectric cable) within a few years. Based on input from Company personnel and actuarial analysis, this study recommends moving to a life of 50 years with a R3 dispersion curve for this account

$\qquad$

## DISTRIBUTION

## Distribution Accounts, FERC Accounts 361-373

FERC Account 361 Distribution Structures \& Improvements (proposed 63 year life with a R2.5 dispersion curve)

This grouping contains facilities ranging from fencing to other structures found in distribution substations. The current investment balance for Minnesota is \$43.7 million for this account. The current approved life is a 60 years with a R3 dispersion curve. Life analysis results are based on a total Company data. Company personnel anticipate a longer life than currently approved with the expectation that it will be less than Account 352, Transmission Structures and Improvements. After analyzing actuarial analysis results, a life of 63 years with a R2.5 dispersion curve is recommended for this account.

$\qquad$

## FERC Account 362 Distribution Station Equipment (proposed 53 year life with a R2 dispersion curve)

This grouping contains a wide variety of distribution substation equipment, from circuit breakers to switchgear. The current investment balance for Minnesota is $\$ 553.0$ million. The current approved life is a 55 years with a R1.5 dispersion curve. Life analysis results are based on total Company data. Company personnel expect the life of this account will be slightly less than Account 353, Transmission Substation Equipment. Multiple placement and experience bands show that a 53 year life with a R2 dispersion curve is a good fit for many bands. Based on Company history and judgment, this study recommends a life of 53 years with a R2 dispersion curve for this account.

$\qquad$

## FERC Account 364 Distribution Poles, Towers \& Fixtures (proposed 47 year life with a R1 dispersion curve)

This account contains poles and towers of various material types: wood and steel. Most of the poles across the system are made of wood. The height of these assets can range from 35 feet to 70 feet with the prevalent sizes being 45 feet and up. The current investment balance for Minnesota is $\$ 343.5$ million for this account. The current approved life is 44 years with a R1 dispersion curve. Life analysis results are based on total Company data. SPR analysis was used since actuarial results are available from 2001 forward only. Company personnel report that western red cedar poles were used up to 10 years ago and poles are now treated pine. Company experts believe the life of cedar would probably be 40-45 years and treated pine would be less than 40 years. The two biggest issues are rot and relocations. A pole testing program is producing proactive replacement activity. Fiberglass cross arms are starting to be installed which will have a longer life. Steel is only used when building near a transmission structure. Based on life analysis results and input from Company personnel a 47 year life with a R1 dispersion curve is recommended for this account. A comparison of actual versus simulated balances is shown below.

$\qquad$

## FERC Account 365 Distribution Overhead Conductor \& Devices (proposed 39 year life with a LO dispersion curve)

This account consists of overhead conductor of various thickness, as well as various switches and reclosers. The current investment balance for Minnesota is $\$ 373.2$ million for this account. The current approved life is a 39 years with a L0 dispersion curve. Life analysis results are based on total Company data. Company personnel report that insulators are made of porcelain and polymer. Polymer has only been used for the past 8-12 years, so there is limited experience. The primary reasons for retirements are overloads, tree issues, more than 2 splices in a span, and capacity issues. Life analysis shows a shorter life than poles with life increasing in the narrowest bands. Based on life analysis and judgment, a 39 year life with a LO dispersion curve is recommended for this account. A comparison of actual versus simulated balances is shown below.

$\qquad$

## FERC Account 366 Distribution Underground Conduit (proposed 56 year life with a R3 dispersion curve)

This account consists of conduit, duct banks, vaults, manholes, and ventilating system equipment. The current investment balance for Minnesota is $\$ 261.3$ million for this account. The current approved life is 52 years with a R3 dispersion curve. After reviewing SPR results, a mid-range dispersion appears is the best fit. After review of multiple bands, this study recommends a 56 year life while retaining the R3 dispersion curve. A comparison of the actual vs. simulated balances is shown below.

Northern States Power - MN Account 366 Actual vs Simulated Balance 56 R3

$\qquad$

## FERC Account 367 Distribution Underground Conductor \& Devices (proposed 49 life with a R1.5 dispersion curve)

This account consists of underground distribution conductor, switches, and switchgear. The current investment balance for Minnesota is $\$ 967.9$ million for this account. The currently approved life is a 45 years with a R2.5 dispersion curve. Life analysis results are based on total Company data. The SPR method was used to select the life parameter for this account. The best ranked curve with an REI of 100 across multiple bands was the 49 R1.5. After review of multiple bands, this study recommends a 49 year life while moving to a R1.5 dispersion curve. A comparison of the actual vs. simulated balances is shown below.

$\qquad$

## FERC Account 369 Distribution Services - Overhead (proposed 42 year life with a R1.5 dispersion curve)

This account includes overhead services with a current investment balance in Minnesota of $\$ 71.6$ million. The current approved life is 40 years with a R1.5 dispersion. Life analysis results are based on total Company data. Company experts expect the life for services, both underground and overhead to be approximately 40 years. Many overhead services have been replaced for aesthetic reasons. After viewing SPR results and comparing actual versus simulated balances, a 42 year life with a R1.5 dispersion curve is recommended for this account.

$\qquad$

## FERC Account 369 Distribution Services - Underground (proposed 44 year life with a R4 dispersion curve)

This account includes underground services and has a current investment balance in Minnesota of $\$ 185.8$ million. The currently approved life is 41 years with a R4 dispersion curve. Life analysis results are based on total Company data. Company experts expect the life for services, both underground and overhead to be approximately 40 years. Better materials have been used for underground services since the 1970s. After viewing SPR results and comparing actual versus simulated balances, a 44 year life with a R4 dispersion curve is recommended for this account.

$\qquad$

FERC Account 373 Distribution Street Lighting \& Signal Systems (proposed 29 year life with a LO dispersion curve)

This account includes all distribution streetlights, conductor, conduit, luminaire, and standards. The current investment balance for Minnesota is \$64.2 million. The current approved life is 29 years with a LO dispersion curve. Life analysis results are based on total Company data. SPR was used on this account, since actuarial results are only available from 2001 forward. The LO is the top curve for many bands. As the band becomes narrower, the life increases. A comparison of the proposed curve vs. actual data is shown below. Based on judgment and Company experience, a 29 year life with a L0 dispersion curve is recommended for this account.

$\qquad$

## GENERAL

General Accounts, FERC Accounts 390

## FERC Account 390 General Structures \& Improvements (proposed 55 year life with a R1.5 dispersion curve)

This account includes the cost of general structures and improvements used for utility service. The current investment balance is $\$ 63.5$ million. The current approved life is 57 years with a R1.5 dispersion curve. Many components such as heating, ventilation, and air conditioning ("HVAC") systems, lighting, controls, finishes, and roofing in buildings will have a much shorter life than the structure itself. Some consolidation of buildings occurs, but the Company redeploys buildings for other use when possible. Going forward, Company personnel expect to replace roofs at 20 years (currently have some that have only lasted 10 years and some that have lasted 25 years or longer) and anticipate the same time frame for HVAC (which would include boilers, cooling towers, chillers, etc.). Depending on the location (heat or heavy trucks can shorten life), parking lots would be expected to last 15-20 years. At that point, the Company would tear up the old lot, retire and replace it with a new one. Removal cost is charged for replacing lots - a fixed percentage that can change based on specific facts of the project. The average age of buildings is over 40 years. Based on the analysis and mix of assets, this study recommends moving to a 55 year life with a R1.5 dispersion curve.
$\qquad$
Petition
Schedule D - Page 45 of 170

## FERC Account 390 General Structures \& Improvements - Leased (proposed 10 life with a SQ dispersion curve)

This account includes the cost of leasehold improvements used for utility service. There is approximately $\$ 36$ thousand in this account which is fully accrued. The approved life for this account is 10 years with a SQ dispersion curve. Based on type of assets this study recommends retaining the existing 10 year life with a SQ dispersion curve. However, if the lease term changes the asset life should change accordingly. No graph is shown.
$\qquad$

## ELECTRIC VINTAGE GROUP (AMORTIZED) ACCOUNTS

For many years, NSP has used vintage group amortization where assets are large in number, but low in cost. To implement this amortization mechanism, it is necessary to first retire the assets whose age is longer than the recommended service life for each group are retired. Then, the remaining plant in service for each account is amortized using the amortization rates shown in Appendix A-1 and B. Annually, assets which reach the average service life of each account are retired when the assets reach their average service life. Thus no dispersion curve is used for assets being recovered through vintage group amortization.

## DISTRIBUTION

## FERC Account 368 Distribution Line Transformers (proposed 32 year life)

This account consists of line transformers and regulators. The current investment is $\$ 372.6$ million for Minnesota in this account. The current approved life of 32 years should be retained.

## FERC Account 368 Distribution Line Capacitors (proposed 25 year life)

This account consists of line capacitors. The current investment is \$18.8 million for Minnesota in this account. However, $\$ 3.6$ million is considered fully depreciated, so the adjusted balance is $\$ 15.2$ million. The current approved life of 25 years should be retained.

## FERC Account 370 Distribution Meters (proposed 15 year life)

This account includes new distribution meters. The current investment is $\$ 96.3$ million for Minnesota. However, $\$ 42.0$ million is considered fully depreciated, so the adjusted balance is $\$ 54.3$ million. The current approved life of 15 years should be retained.
$\qquad$

## GENERAL PLANT VINTAGE GROUP (AMORTIZED) ACCOUNTS FERC Account 303 Intangible Computer Software - 5 year (proposed 5 year

 life)This account consists of miscellaneous computer software. The current investment is $\$ 115.2$ million. However, $\$ 27.8$ million is considered fully accrued so the adjusted balance is $\$ 87.4$ million. The current approved life of 5 years should be retained.

## FERC Account 391 General Office Furniture \& Equipment (proposed 20 year life)

This account consists of miscellaneous office furniture such as desks, chairs, filing cabinets, and tables used for general utility service. The current investment is $\$ 27.6$ million. The current approved life of 20 years should be retained.

## FERC Account 391 General Network Equipment (proposed 6 year life)

This account consists of computer equipment used for general utility service. The current investment is $\$ 32.4$ million. The currently approved life is 4 years. Interviews with Company personnel show this equipment is lasting longer, and this study recommends moving to a 6 year life for this account.

## FERC Account 392 General Transportation Equipment - Automobiles (proposed 10 year life)

This account consists of automobiles used for general utility service. The current investment is $\$ 1.1$ million. The current approved life of 10 years should be retained.

FERC Account 392 General Transportation Equipment - Light Trucks (proposed 10 year)

This account consists of light trucks used for general utility service. The
$\qquad$
current investment is $\$ 32.8$ million. However, $\$ 6.2$ million is considered fully accrued so the adjusted balance is $\$ 26.6$ million. The current approved life is 12 years. Interviews with Company personnel show they are retiring light trucks earlier than in the past; therefore, this study recommends moving to a 10 year life for this account.

## FERC Account 392 General Transportation Equipment - Trailers (proposed 12 year life)

This account consists of trailers used for general utility service. The current investment is $\$ 17.9$ million. The current approved life is 15 years. Interviews with Company personnel show they are retiring trailers earlier than in the past; therefore, this study recommends moving to a 12 year life for this account.

## FERC Account 392 General Transportation Equipment - Heavy Trucks (proposed 12 year)

This account consists of heavy trucks used for general utility service. The current investment is $\$ 97.6$ million. However, $\$ 4.1$ million is considered fully accrued so the adjusted balance is $\$ 93.5$ million. The current approved life is 14 years. Interviews with Company personnel show they are retiring heavy trucks earlier than in the past; therefore, this study recommends moving to a 12 year life for this account.

## FERC Account 393 General Stores Equipment (proposed 20 year)

This account consists of stores equipment used for general utility service. The current investment is $\$ 1.6$ million. The current approved life of 20 years should be retained.

## FERC Account 394 General Tools, Shop \& Garage Equipment (proposed 15 year life)

This account consists of various items or tools used in shop and garages
$\qquad$
such as air compressors, grinders, mixers, hoists, and cranes. The current investment is $\$ 81.3$ million. However, $\$ 188$ thousand is considered fully accrued so the adjusted balance is $\$ 81.1$ million. The current approved life of 15 years should be retained.

## FERC Account 395 General Laboratory Equipment (proposed 10 year life)

This account consists of laboratory equipment used in general utility service. The current investment is $\$ 3.2$ million. The current approved life of 10 years should be retained.

## FERC Account 396 General Power Operated Equipment (proposed 12 year life)

This account consists of bulldozers, forklifts, trenchers, and other power operated equipment that cannot be licensed on roadways. The current investment is $\$ 45.1$ million. The current approved life is 12 years should be retained.

## FERC Account 397 General Communication Equipment (proposed 10 year life)

This account consists of miscellaneous communication equipment used in general utility service. The current investment is $\$ 17.1$ million. However, $\$ 159$ thousand is considered fully accrued so there will be an adjusted balance of \$16.9 million. The current approved life of 9 years. Interviews with Company personnel show this equipment is lasting longer, and this study recommends moving to a 10 year life for this account.

## FERC Account 397 General Communication Equipment - Two Way (proposed 10 year life)

This account consists of miscellaneous two way communication equipment used in general utility service. The current investment is $\$ 6.5$ million. The current approved life is 9 years. Interviews with Company personnel show this equipment is lasting longer, and this study recommends moving to a 10 year life for this account.

## FERC Account 397 General Communication Equipment - AES (proposed 15 year life)

This account consists of miscellaneous automated energy services ("AES") including electronic or automated meter reading communication equipment used in general utility service. The current investment is $\$ 7.1$ million. The current approved life of 15 years should be retained.

## FERC Account 397 General Communication Equipment - EMS (proposed 15 year life) <br> This account consists of energy management system ("EMS") communication equipment used for energy monitoring and controlling equipment to manage general utility service. The current investment is $\$ 47.3$ million. The current approved life of 15 years should be retained.

## FERC Account 398 General Miscellaneous Equipment (proposed 15 year life)

This account consists of miscellaneous equipment used in general utility service. The current investment is $\$ 2.72$ million. However, $\$ 66$ thousand is considered fully accrued so there will be an adjusted balance of $\$ 2.66$ million. The current approved life of 15 years should be retained.
$\qquad$

## GAS PLANT

## TRANSMISSION

Transmission Accounts, FERC Accounts 366-369
FERC Account 366 Transmission Structures \& Improvements (proposed 65 year life with a R4 dispersion curve)

This account includes the cost of structures and improvements used in conjunction with transmission operations such as buildings, fences, or other structures. The plant balance in this account is $\$ 1.1$ million. The current approved life is 52 years with a R3 dispersion curve. Life analysis shows a longer life. Based on actuarial analysis, a 65 year life with a R4 dispersion curve is recommended. A graph of the observed life table vs. the proposed life and curve is shown below.

## FERC Account 367 Transmission Mains (proposed 75 year life with a R2.5 dispersion curve)

This account includes the cost of transmission system mains including excavation costs, pipe, valves, and other equipment. The plant balance in this account is $\$ 65.8$ million. The current approved life is 75 years with a R2.5 dispersion curve. There are only 100 miles of transmission mains in Minnesota nothing older than 1940s (very few miles prior to 1950s). A large project started in 2013 to replace nearly $15 \%$ of the transmission pipe (pressure coupled). Much of it was installed in late 1960s and early 1970s. For the existing asset base, 13 miles was installed in the 1940s, 27 miles in 1950s, 6 miles in the 60s, 10 miles in the 70 s, 3 miles in the 80s, 13 miles in the 1990s (1995), with the rest being newer. Based on actuarial analysis and the mix of assets, this study recommends retaining a 75 year life with a R2.5 dispersion curve. A graph of actual data versus the proposed curve is shown below.

$\qquad$

## FERC Account 369 Transmission Measure \& Regulating Station Equipment (proposed 40 year life with a R1 dispersion curve)

This account includes the costs of meters, gauges, and other equipment used to measure or regulate gas in connection with transmission city gate (town border station) operations. The plant balance in this account is $\$ 13.6$ million. The current approved life is 33 years with a R1.5 dispersion curve. Measurement equipment is replaced as technology improves - (e.g. from mercury meters, to chart recorders, to electronic flow meters). Life indications across various placement and experience bands show the 40 R1 to be a good match. Based on actuarial analysis and the mix of assets, this study recommends moving to a 40 year life with a R1 dispersion curve. A graph of actual data versus the proposed curve is shown below.

$\qquad$

## DISTRIBUTION

## Distribution Accounts, FERC Accounts 375-380

## FERC Account 375 Distribution Structures \& Improvements (proposed 50 year

 life with a R5 dispersion curve)This account consists of small structures and improvements to such structures and associated assets at city gates and on the main line distribution system. The current investment is $\$ 728$ thousand for Minnesota. The current approved life is 41 year life with a R5 dispersion curve. Based on judgment and general expectations for structures, this study recommends moving to a 50 year life while retaining the R5 dispersion curve for this account. A graph of actual data versus the proposed curve is shown below.

$\qquad$

## FERC Account 376 Distribution Mains - Metallic (proposed 63 year life with a

## R2 dispersion curve)

This account includes all steel mains. The current approved life is 51 years with a R1.5 dispersion curve. The current investment balance for Minnesota is $\$ 135.1$ million for this account. Life analysis results are based on total Company data. The average age of facilities is younger than many other utilities driven by growth in the mid to late 1990s. Actuarial data only exists from 2001 forward. SPR analysis shows a longer life in more recent periods. Based on judgment, this study recommends a change to a 63 year life with a R2 dispersion curve for this account. A comparison of actual versus simulated balances is shown below for the 63 year life with a R2 dispersion curve.

$\qquad$

## FERC Account 376 Distribution Mains - Plastic (proposed 54 year life with a

## R2.5 dispersion curve)

This account includes all plastic mains. The current approved life is 45 years with a R2.5 dispersion curve. The current investment balance for Minnesota is $\$ 384.4$ million for this account. Life analysis results are based on total Company data. Company personnel report that $99 \%$ of new distribution mains are plastic. The Company is aggressively replacing pre 1960's assets, with early 1970's polyethylene targeted next. Actuarial data only exists from 2001 forward. SPR analysis shows a similar life to the existing approved life. Based on judgment, this study recommends a 54 year life with a R2.5 dispersion curve. A comparison of actual versus simulated balances is shown below for the 54 year life and R2.5 dispersion curve.

$\qquad$

## FERC Account 378 Distribution Measure \& Regulating Station Equipment General (proposed 38 year life with a $\mathbf{R 0} .5$ dispersion curve)

This account consists of meters, gauges, and other equipment used in measuring and regulating gas in connection with distribution system operations other than the measurement of gas deliveries city gate and to customers. The current approved life is a 38 year life with a R0.5 dispersion curve. The current investment balance for Minnesota is $\$ 22.8$ million for this account. Life analysis results are based on total Company data. Consistent with the last depreciation study, this study combines the assets in Account 378 and 379 due to the similarity between the assets in each account. Actuarial analysis showed that a 38 year life with a R 0.5 dispersion curve is a good match across the various experience bands. This study recommends retaining the existing 38 year life with a R0.5 dispersion. A graph of actual data versus the proposed curve is shown below.

## FERC Account 379 Distribution Measure \& Regulating Station Equipment City Gate (proposed 38 year life with a R0.5 dispersion curve)

This account includes the measuring and regulating devices and other apparatus at city gate stations. There is a current investment of $\$ 1.4$ million for Minnesota in this account. The current approved life is a 38 year life with a R0.5 dispersion curve. Consistent with the prior study Account 378 and 379 were combined for life analysis purposes due to the similarity of the assets, similarity of use and expected lives. The resulting recommendation is a 38 year life with a R0.5 dispersion curve for both accounts. A graph of actual data versus the proposed curve is shown above in Account 378.
$\qquad$

## FERC Account 380 Distribution Services - Metallic (proposed 51 year life with a R3 dispersion curve)

Service lines are the steel pipes and accessories leading from the main to the customers' premises. This account has a current investment of $\$ 12.6$ million for Minnesota. The current approved life is 40 years with a S 3 dispersion curve. Life analysis results are based on total Company data. Age is the primary driver of retirement of services. In a renewal area (road or otherwise), the practice is to renew all services when mains are renewed. Normal processes also trigger replacements (e.g. leak issues or compression coupled). Since actuarial data exists only for 2001 forward, this account was analyzed using SPR. Life analysis results show a longer life for this account than is currently approved. Since processes are in place to improve life expectations in this account, this study recommends moving to a 51 year life and R3 dispersion curve for this account. A comparison of actual versus simulated balances is shown below for the 51 R3 curve.

$\qquad$

## FERC Account 380 Distribution Services - Plastic (proposed 39 year life with a

## R2.5 dispersion curve)

Service lines are the plastic pipes and accessories leading from the main to the customers' premises. This account has a current investment of $\$ 272.7$ million for Minnesota. Life analysis results are based on total Company data. The current approved life is 39 R2.5. Since actuarial data exists only for 2001 forward, this account was analyzed using SPR. Life analysis results show a similar life to the existing approved life for this account. This study recommends retaining the existing 39 year life with a R2.5 dispersion curve for this account. A comparison of actual versus simulated is shown for the proposed 39 year life and R2.5 dispersion curve.

$\qquad$

## GENERAL

## General Accounts, FERC Accounts 390

## FERC Account 390 General Structures \& Improvements (proposed 55 year life with a R1.5 dispersion curve)

This account includes the cost of general structures and improvements used for utility service. The current investment balance is $\$ 1.5$ million. The current approved life is 55 years with a R1.5 dispersion curve. Gas mortality data in this account shows a shorter life than currently approved, but this trend is not expected to continue. Based on judgment, this study proposes to retain the existing 55 year life with a R1.5 dispersion curve for this account. A graph of the proposed curve for this account is shown below.

GAS VINTAGE GROUP (AMORTIZED) ACCOUNTS GAS DISTRIBUTION

## Account 381 Distribution Meters (proposed 20 year life)

This account includes the cost of meters and house regulators installed after 1994. The current investment is $\$ 105.1$ million for Minnesota. However, $\$ 12.9$ million is considered fully accrued and results in an adjusted study balance of \$92.2 million. The current approved life of 20 years should be retained.

## Account 381 Distribution Meters - Telemetering (proposed 8 year life)

This account includes the cost of telemetering assets. The current investment is $\$ 37$ thousand for Minnesota. However, the current investment is fully amortized. The current approved life of 8 years should be retained. This analysis is for any future investment in this account.

## Account 383 Distribution House Regulators (proposed 20 year life)

This account includes the cost of house regulators installed before 1995 that were not combined with the meter account. The current investment is $\$ 10.1$ million for Minnesota. The current approved life of 20 years should be retained.
$\qquad$
Petition

## GAS GENERAL PLANT VINTAGE GROUP (AMORTIZED) ACCOUNTS

The same life parameters used for electric plant are proposed for amortized gas plant due to the similar operations and policies. The table below summarizes recommendations and plant balances by account.

| Acct | Description | Plant \$ x 000 | Fully <br> Accrued <br> \$ x 000 | Adjusted \$ $\times 000$ | Current Life | Proposed Life |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |

$\qquad$

## COMMON UTILITY PLANT DEPRECIATED ACCOUNTS

General Accounts, FERC Accounts 390
FERC Account 390 General Structures \& Improvements (proposed 50 year life with a LO dispersion curve)

This account includes the cost of general structures and improvements used for utility service. There is approximately $\$ 151.8$ million in this account. The approved life for this account is 55 years and a R1.5 dispersion curve. Based on actuarial analysis, this study recommends moving to a 50 year life with a LO dispersion curve.

## FERC Account 390 General Structures \& Improvements - Leased (proposed 10 life with a SQ dispersion curve)

This account includes the cost of leasehold improvements used for utility service. There is approximately $\$ 18.5$ million in this account for one property where the lease is set to expire June 2026. The approved life for this account is 10 years with a SQ dispersion curve. Based on type of assets this study recommends retaining the existing 10 year life with a SQ dispersion curve. However, if the lease term changes the asset life should change accordingly. No graph is shown.

## GENERAL PLANT VINTAGE GROUP (AMORTIZED) ACCOUNTS

The same life parameters used for electric and gas plant are proposed for amortized common plant due to the similar operations and policies with the exception of Account 391 Network Equipment. In Common plant, there are a large number of laptops booked in this account and a 5 year life is recommended for Common plant. The table below summarizes recommendations and plant balances by account.

| Acct | Description | $\begin{gathered} \text { Plant } \\ \$ \times 000 \end{gathered}$ | Fully Accrued \$ $\times 000$ | $\begin{array}{r} \text { Adjusted } \\ \$ \times 000 \\ \hline \end{array}$ | Current Life | $\begin{gathered} \text { Proposed } \\ \text { Life } \end{gathered}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |

## Salvage Analysis

When a capital asset is retired, physically removed from service and finally disposed of, terminal retirement is said to have occurred. The residual value of a terminal retirement is called gross salvage. Net salvage is the difference between the gross salvage (what the asset was sold for) and the removal cost (cost to remove and dispose of the asset). Salvage and removal cost percentages are calculated by dividing the current cost of salvage or removal by the original installed cost of the asset. Some plant assets can experience significant negative removal cost percentages due to the timing of the original addition versus the retirement.

The net salvage analysis uses the history of the individual accounts to estimate the future net salvage that NSP can expect in its operations. This study also removes reimbursements for relocations that may have been booked to gross salvage. Any associated retirements are also removed from the data for consistency. As a result, the analysis not only looks at the historical experience of NSP, but also takes into account recent and expected changes in operations that could reasonably lead to different future expectations for net salvage than were experienced in the past.

## Salvage Characteristics

For most accounts, data for retirements, gross salvage, and cost of removal for each account is available from 1950-2016. Some accounts have shorter periods with available data. Moving averages, which remove timing differences between retirement and salvage and removal cost, were analyzed over periods varying from two to 10 years.
$\qquad$

## ELECTRIC PLANT <br> TRANSMISSION

Transmission Accounts, FERC Accounts 352-358

## FERC Account 352 Transmission Structures \& Improvements (proposed negative 5 percent net salvage)

This account consists of any gross salvage and cost of removal associated transmission structures and improvements which include buildings, fencing and other structures found in a transmission substation. The approved net salvage for this account is 0 percent. The most recent moving averages show negative net salvage and increased costs of removal due to changes in capacity and station reconfiguration. Taking that into consideration, negative 5 percent net salvage for this account is recommended.

## FERC Account 353 Transmission Station Equipment (proposed negative 15 percent net salvage)

This account consists of any gross salvage and cost of removal associated with transmission substation equipment, from circuit breakers to switchgear. The approved net salvage for this account is negative 10 percent. The most recent 5 and 10 year moving averages show negative 16.93 percent and negative 20.10 percent net salvage respectively. Moving in the direction of that trend, negative 15 percent net salvage for this account is recommended.

## FERC Account 354 Transmission Towers \& Fixtures (proposed negative 35 percent net salvage)

This account consists of any gross salvage and cost of removal associated with transmission towers and fixtures, which are used to transmit electricity at a voltage of 69 kV and above. This study recommends the current approved net salvage of negative 35 percent should be retained.
$\qquad$

FERC Account 355 Transmission Poles \& Fixtures (proposed negative 50 percent net salvage)

This account consists of any gross salvage and cost of removal associated with transmission poles and fixtures, which are used to transmit electricity at a voltage of 69 kV and above. The approved net salvage for this account is negative 35 percent. The most recent 5 and 10 year moving averages show negative 108.84 percent and negative 105.28 percent net salvage respectively. Moving in the direction of that trend, negative 50 percent net salvage for this account is recommended.

## FERC Account 356 Transmission Overhead Conductor \& Devices (proposed negative 35 percent net salvage)

This account consists of any gross salvage and cost of removal associated with Transmission overhead conductors, which are used to transmit electricity at voltages of 69 kV and above. The approved net salvage for this account is negative 30 percent. The most recent 5 and 10 year moving averages show negative 69.71 percent and negative 41.68 percent net salvage respectively. Moving in the direction of that trend, negative 35 percent net salvage for this account is recommended.

## FERC Account 357 Transmission Underground Conduit (proposed 0 percent net salvage)

This account consists of any gross salvage and cost of removal associated with underground conduit. The approved net salvage for this account is 0 percent. There is limited retirement and net salvage activity in recent years. . Based on judgment, retention of 0 percent net salvage for this account is recommended.

## FERC Account 358 Transmission Underground Conductor \& Devices (proposed negative 5 percent net salvage)

This account consists of any gross salvage and cost of removal associated
$\qquad$
with underground conductor. The lines are low pressure oil filled; paper wrapped 500 MCM copper cable. The approved net salvage for this account is 0 percent. Data is limited for this account. The most recent 5 and 10 year moving averages show negative 132.36 percent and negative 16.03 percent net salvage, respectively. Retirement data is limited for this account, however removal costs are sometimes quite high when retirements occur; therefore, moving to negative 5 percent net salvage for this account is recommended.

## DISTRIBUTION

## Distribution Accounts, FERC Accounts 361-373

## FERC Account 361 Distribution Structures \& Improvements (proposed negative 30 percent net salvage)

This account contains any gross salvage and cost of removal associated with facilities ranging from fencing to other structures found in distribution substations. The approved net salvage for this account is negative 30 percent. The most recent 5 and 10 year moving averages show negative 196.40 percent and negative 139.35 percent net salvage respectively. Since there is a low level of retirement data and it is sporadic for this account, retention of negative 30 percent net salvage for this account is recommended.

## FERC Account 362 Distribution Station Equipment (proposed negative 25 percent net salvage)

This account contains any gross salvage and cost of removal associated with a wide variety of distribution substation equipment, from circuit breakers to switchgear. The approved net salvage for this account is negative 20 percent The most recent 5 and 10 year moving averages show negative 26.77 percent and negative 26.68 percent net salvage respectively. Moving in the direction of that trend, negative 25 percent net salvage for this account is recommended.
$\qquad$

## 120 percent net salvage)

This account contains any gross salvage and cost of removal associated with poles and towers of various material types: wood and steel. The approved net salvage for this account is negative 100 percent. The most recent 5 and 10 year moving averages show negative 255.40 percent and negative 244.52 percent net salvage respectively. Moving in the direction of that trend, negative 120 percent net salvage for this account is recommended.

## FERC Account 365 Distribution Overhead Conductor \& Devices (proposed negative 25 percent net salvage)

This account consists of any gross salvage and cost of removal associated with overhead conductor of various thickness, as well as various switches and reclosers. The approved net salvage for this account is negative 20 percent. The most recent 5 and 10 year moving averages show negative 44.23 percent and negative 33.49 percent net salvage respectively. Moving in the direction of that trend, negative 25 percent net salvage for this account is recommended.

## FERC Account 366 Distribution Underground Conduit (proposed negative 20 percent net salvage)

This account consists of any gross salvage and cost of removal associated with conduit, duct banks, vaults, manholes, and ventilating system equipment. The approved net salvage for this account is negative 10 percent. The most recent 5 and 10 year moving averages show negative 276.23 percent and negative 89.75 percent net salvage respectively. Moving in the direction of that trend, negative 20 percent net salvage for this account is recommended.

## FERC Account 367 Distribution Underground Conductor \& Devices (proposed negative 10 percent net salvage)

This account consists of any gross salvage and cost of removal associated with underground distribution conductor, switches, and switchgear. The approved
$\qquad$
net salvage for this account is 0 percent. The most recent 5 and 10 year moving averages show negative 45.44 percent and negative 26.99 percent net salvage respectively. Moving in the direction of that trend, a negative 10 percent net salvage for this account is recommended.

## FERC Account 369 Distribution Services - Overhead (proposed negative 85 percent net salvage)

This account includes any gross salvage or cost of removal associate with overhead services. The approved net salvage for this account is negative 70 percent. The last depreciation study combined data for overhead and underground services, whereas this study separates the two. The most recent 5 and 10 year moving averages show negative 163.18 percent and negative 127.99 percent net salvage respectively. Moving in the direction of that trend, negative 85 percent net salvage for this account is recommended.

## FERC Account 369 Distribution Services - Underground (proposed negative 5 percent net salvage)

This account includes any gross salvage and cost of removal associated with underground services. The approved net salvage for this account is negative 5 percent. The last study combined data for overhead and underground services, whereas this study separates the two. The most recent 5 and 10 year moving averages show negative 50.02 percent and negative 7.72 percent net salvage respectively. Retaining the existing negative 5 percent net salvage for this account is recommended.

## FERC Account 373 Distribution Street Lighting \& Signal Systems (proposed negative 40 percent net salvage)

This account includes any gross salvage and cost of removal associated with distribution streetlights, conductor, conduit, luminaire, and standards. The approved net salvage for this account is negative 35 percent. The most recent 5 and 10 year
$\qquad$
moving averages show negative 90.29 percent and negative 91.90 percent net salvage respectively. Moving in the direction of that trend, negative 40 percent net salvage for this account is recommended.

## GENERAL

General Accounts, FERC Accounts 390
FERC Account 390 General Structures \& Improvements (proposed negative 20 percent net salvage)

This account includes the any gross salvage and cost of removal associated with cost of general structures and improvements used for utility service. The approved net salvage for this account is negative 20 percent. The most recent 5 and 10 year moving averages show negative 15.70 percent and negative 19.32 percent net salvage respectively. Retaining the existing, negative 20 percent net salvage for this account is recommended.

## ELECTRIC VINTAGE GROUP (AMORTIZED) ACCOUNTS

## DISTRIBUTION

## FERC Account 368 Distribution Line Transformers (proposed negative 5 percent net salvage)

This account consists of any gross salvage and cost of removal associated with line transformers and regulators. The approved net salvage for this account is negative 5 percent. The most recent 5 year moving averages shows negative 10.45 and negative 9.37 percent respectively. Removal and salvage vary fairly significantly over time. Therefore, retaining negative 5 percent net salvage for this account is recommended.

## FERC Account 368 Distribution Line Capacitors (proposed negative 7 percent net salvage)

This account consists of line capacitors. The approved net salvage for this
$\qquad$
account is negative 10 percent. The most recent 5 and 10 year moving averages show negative 4.18 percent and negative 6.77 percent net salvage respectively. Moving in the direction of that trend, negative 7 percent net salvage for this account is recommended.

## FERC Account 370 Distribution Meters (proposed negative 5 percent net salvage)

This account includes any gross salvage and cost of removal associated with new distribution meters. The approved net salvage for this account is zero percent. The most recent 5 and 10 year moving averages show negative 7.99 percent and negative 11.77 percent net salvage respectively. Moving in the direction of that trend, negative 5 percent net salvage for this account is recommended.

## FERC Account 370 Distribution Meters - Old (proposed zero percent net salvage)

This account includes any gross salvage and cost of removal associated with all old distribution meters. The approved net salvage for this account is zero percent. Limited data shows zero percent net salvage for this account. Thus, retention of zero percent net salvage for this account is recommended.
$\qquad$

#### Abstract

GENERAL PLANT VINTAGE GROUP (AMORTIZED) ACCOUNTS FERC Account 303 Intangible Computer Software - 5 year (proposed zero percent net salvage)

This account consists of any gross salvage and cost of removal associated with miscellaneous computer software. The approved net salvage for this account is zero percent. The most recent 5 and 10 year moving averages show zero percent net salvage. Based on history and judgment, retention of zero percent net salvage for this account is recommended.

## FERC Account 391 General Office Furniture \& Equipment (proposed zero percent net salvage)

This account consists of any gross salvage and cost of removal associated with miscellaneous office furniture such as desks, chairs, filing cabinets, and tables used for general utility service. The approved net salvage for this account is zero percent. The most recent 5 and 10 year moving averages show negative 4.52 percent and negative 1.43 percent, respectively. Based on history and judgment, retention of zero percent net salvage for this account is recommended.

## FERC Account 391 General Network Equipment (proposed zero percent net salvage)

This account consists of any gross salvage and cost of removal associated with computer equipment used for general utility service. The approved net salvage for this account is zero percent. The most recent 5 and 10 year moving average shows zero percent net salvage for both periods. Based on history and judgment, retention of zero percent net salvage for this account is recommended.

## FERC Account 392 General Transportation Equipment - Automobiles (proposed 5 percent net salvage)

This account consists of any gross salvage and cost of removal associated with automobiles used for general utility service. The approved net salvage for this
$\qquad$
account is zero percent. In the last depreciation study, the Company applied any gross salvage for transportation equipment to the new asset. That practice has been discontinued and all salvage proceeds are now being booked to the accumulated provision for depreciation. Based on recent retirement history, 5 percent net salvage for this account is recommended.

## FERC Account 392 General Transportation Equipment - Light Trucks (proposed 10 percent net salvage)

This account consists of any gross salvage and cost of removal associated with light trucks used for general utility service. The approved net salvage for this account is zero percent. In the last depreciation study, the Company applied any gross salvage for transportation equipment to the new asset. That practice has been discontinued and all salvage proceeds are now being booked to the accumulated provision for depreciation. Based on recent retirement history, 10 percent net salvage for this account is recommended.

## FERC Account 392 General Transportation Equipment - Trailers (proposed 20 percent net salvage)

This account consists of any gross salvage and cost of removal associated with trailers used for general utility service. The approved net salvage for this account is zero percent. In the last depreciation study, the Company applied any gross salvage for transportation equipment to the new asset. That practice has been discontinued and all salvage proceeds are now being booked to the accumulated provision for depreciation. Based on recent retirement history, 20 percent net salvage for this account is recommended.

## FERC Account 392 General Transportation Equipment - Heavy Trucks (proposed 15 percent net salvage)

This account consists of any gross salvage and cost of removal associated with heavy trucks used for general utility service. The approved net salvage for this
$\qquad$
account is zero percent. In the last depreciation study, the Company applied any gross salvage for transportation equipment to the new asset. That practice has been discontinued and all salvage proceeds are now being booked to the accumulated provision for depreciation. Based on recent retirement history, 15 percent net salvage for this account is recommended.

## FERC Account 393 General Stores Equipment (proposed zero percent net salvage)

This account consists of any gross salvage and cost of removal associated with stores equipment used for general utility service. The approved net salvage for this account is zero percent. The most recent 5 and 10 year moving averages show less than 1 percent net salvage for both periods. Based on history and judgment, retention of zero percent net salvage for this account is recommended.

## FERC Account 394 General Tools, Shop \& Garage Equipment (proposed zero percent net salvage)

This account consists of any gross salvage and cost of removal associated with various items or tools used in shop and garages such as air compressors, grinders, mixers, hoists, and cranes. The approved net salvage for this account is zero percent. The most recent 5 and 10 year moving averages show zero percent net salvage. Based on history and judgment, retention of zero percent net salvage for this account is recommended.

## FERC Account 395 General Laboratory Equipment (proposed zero percent net salvage)

This account consists of any gross salvage and cost of removal associated with laboratory equipment used in general utility service. The approved net salvage for this account is zero percent. The most recent 5 and 10 year moving averages show zero percent net salvage. Based on history and judgment, retention of zero percent net salvage is recommended for this account.
$\qquad$

## FERC Account 396 General Power Operated Equipment (proposed 15 percent net salvage)

This account consists of any gross salvage and cost of removal associated with bulldozers, forklifts, trenchers, and other power operated equipment that cannot be licensed on roadways. The approved net salvage for this account is zero percent. In the last depreciation study, the Company applied any gross salvage for transportation equipment to the new asset. That practice has been discontinued and all salvage proceeds are now being booked to the accumulated provision for depreciation. Based on recent retirement history, 15 percent net salvage for this account is recommended.

## FERC Account 397 General Communication Equipment (proposed zero percent net salvage)

This account consists of any gross salvage and cost of removal associated with miscellaneous communication equipment used in general utility service. The approved net salvage for this account is zero percent. The most recent 5 and 10 year moving averages show negative 0.35 percent and negative 0.56 percent net salvage respectively. Following that trend, retention of zero percent net salvage for this account is recommended.

## FERC Account 397 General Communication Equipment - Two Way (proposed zero percent net salvage)

This account consists of any gross salvage and cost of removal associated with miscellaneous two way communication equipment used in general utility service. The approved net salvage for this account is zero percent. Based on experience with the other 397 accounts, retention of zero percent net salvage for this account is recommended.
$\qquad$

## percent net salvage)

This account consists of any gross salvage and cost of removal associated with miscellaneous AES including electronic or automated meter reading communication equipment used in general utility service. The approved net salvage for this account is zero percent. No data for this subaccount exists. Based on experience with the other 397 accounts, retention of zero percent net salvage for this account is recommended.

## FERC Account 397 General Communication Equipment - EMS (proposed zero percent net salvage)

This account consists of any gross salvage and cost of removal associated with EMS communication equipment used for energy monitoring and controlling equipment to manage general utility service. The approved net salvage for this account is zero percent. No data for this subaccount exists. Based on experience with the other 397 accounts and the characteristics of the assets in this account, retention of zero percent net salvage for this account is recommended.

## FERC Account 398 General Miscellaneous Equipment (proposed zero percent net salvage)

This account consists of any gross salvage and cost of removal associated with miscellaneous equipment used in general utility service. The approved net salvage for this account is zero percent. There is minimal retirement experience in this account. The most recent 5 and 10 year moving averages show zero and negative 3.18 percent net salvage, respectively. Based on history and judgment, retention of zero percent net salvage for this account is recommended.
$\qquad$

## GAS DEPRECIATED PLANT

TRANSMISSION
Transmission Accounts, FERC Accounts 366-369

## FERC Account 366 Transmission Structures \& Improvements (proposed negative 5 percent net salvage)

This account includes any gross salvage and cost of removal associated with structures and improvements used in conjunction with transmission operations such as buildings, fences, or other structures. The approved net salvage for this account is negative 5 percent. There is limited retirement activity in this account. Based on history and judgment, retention of negative 5 percent net salvage for this account is recommended.

## FERC Account 367 Transmission Mains (proposed negative 15 percent net salvage)

This account includes any gross salvage and cost of removal associated with the costs of transmission system mains including excavation costs, pipe, valves, and other equipment. The approved net salvage for this account is negative 15 percent. The most recent 5 and 10 year moving averages show negative 65.39 percent and negative 54.80 percent net salvage respectively. The high negative net salvage is driven by large removal cost in one year and is discounted. Based on history and judgment, retention of negative 15 percent net salvage for this account is recommended.

## FERC Account 369 Transmission Measure \& Regulating Station Equipment (proposed negative 30 percent net salvage)

This account includes any gross salvage and cost of removal associated with the costs of meters, gauges, and other equipment used to measure or regulate gas in connection with transmission city gate (town border station) operations. The approved net salvage for this account is negative 30 percent. The most recent 5 and 10 year moving averages show negative 75.01 percent and negative 58.19
$\qquad$
percent net salvage respectively. Based on history and judgment, retention of negative 30 percent net salvage for this account is recommended.

## DISTRIBUTION

## Distribution Accounts, FERC Accounts 375-380

## FERC Account 375 Distribution Structures \& Improvements (proposed negative 5 percent net salvage)

This account any gross salvage and cost of removal associated with small structures and improvements to such structures and associated assets at city gates and on the main line distribution system. The approved net salvage for this account is zero percent. Data is limited for this account. The most recent 10 year moving averages shows negative 63.47 percent net salvage. Moving in the direction of that trend, negative 5 percent net salvage for this account is recommended.

## FERC Account 376 Distribution Mains - Metallic (proposed negative 25 percent net salvage)

This account includes any gross salvage and cost of removal associated with all steel mains. The approved net salvage for this account is negative 20 percent. The most recent 5 and 10 year moving averages show negative 49.60 percent and negative 41.17 percent net salvage respectively. Moving in the direction of that trend, negative 25 percent net salvage for this account is recommended.

## FERC Account 376 Distribution Mains - Plastic (proposed negative 20 percent net salvage)

This account includes any gross salvage and cost of removal associated with all plastic mains. The approved net salvage for this account is negative 15 percent. The most recent 5 and 10 year moving averages show negative 133.57 percent and negative 56.76 percent net salvage respectively. Moving in the direction of that trend, negative 20 percent net salvage for this account is recommended.
$\qquad$

## FERC Account 378 Distribution Measure \& Regulating Station Equipment General (proposed negative 25 percent net salvage)

This account consists of any gross salvage and cost of removal associated with meters, gauges, and other equipment used in measuring and regulating gas in connection with distribution system operations other than the measurement of gas deliveries city gate and to customers. The approved net salvage for this account is negative 25 percent. The most recent 5 and 10 year moving averages show negative 20.03 percent and negative 28.56 percent net salvage respectively. Retention of negative 25 percent net salvage for this account is recommended.

## FERC Account 379 Distribution Measure \& Regulating Station Equipment City Gate (proposed negative 5 percent net salvage)

This account consists of any gross salvage and cost of removal associated with measuring and regulating devices and other apparatus at city gate stations. The approved net salvage for this account is negative 2 percent. The most recent 5 and 10 year moving averages show negative 73.36 percent and negative 71.54 percent net salvage respectively. There are few retirement in recent years in this account which would caution against a significant movement in net salvage. A negative 5 percent net salvage for this account is recommended.

## FERC Account 380 Distribution Services - Metallic (proposed negative 40 percent net salvage)

Service lines are the steel pipes and accessories leading from the main to the customers' premises. The approved net salvage for this account is negative 40 percent. The most recent 5 and 10 year moving averages show negative 40.33 percent and negative 44.77 percent net salvage respectively. Moving in the direction of that trend, negative 40 percent net salvage for this account is recommended.
$\qquad$

## FERC Account 380 Distribution Services - Plastic (proposed negative 25 percent net salvage)

Service lines are the plastic pipes and accessories leading from the main to the customers' premises. The approved net salvage for this account is negative 30 percent. The most recent 5 and 10 year moving averages show negative 11.62 percent and negative 18.24 percent net salvage respectively. The decrease in 2016 is due to a large retirement in 2016. The 5 and 10 year bands from 2015 demonstrate a net salvage more negative than 25 percent. A negative 25 percent net salvage for this account is recommended.

## GENERAL

General Accounts, FERC Accounts 390
FERC Account 390 General Structures \& Improvements (proposed negative 14 percent net salvage)

This account includes any gross salvage and cost of removal associated with cost of general structures and improvements used for utility service. The approved net salvage for this account is negative 20 percent. There has been little retirement activity in this account. Based on data for Account 390 Electric and 390 Common, negative 14 percent net salvage for this account is recommended.
$\qquad$

## GAS VINTAGE GROUP (AMORTIZED) ACCOUNTS

 GAS DISTRIBUTION
## Account 381 Distribution Meters (proposed negative 5 percent net salvage)

This account includes any gross salvage and cost of removal associated with the cost of meters. The approved net salvage for this account is negative 3 percent. The most recent 5 and 10 year moving averages show negative 4.11 percent and negative 5.82 percent net salvage respectively. A negative 5 percent net salvage for this account is recommended.

## Account 381 Distribution Meters - Telemetering (proposed zero percent net salvage)

This account includes any gross salvage and cost of removal associated with the cost of telemetering assets. The approved net salvage for this account is 0 percent. There has been limited retirement experience. Based on data and judgment, retention of zero percent net salvage for this account is recommended. This analysis is for any future investment in this account. The investment in this account is fully amortized in 2017.

## Account 383 Distribution House Regulators (proposed negative 1 percent net salvage)

This account includes any gross salvage and cost of removal associated with cost of house regulators. The approved net salvage for this account is zero percent. The most recent 10 year moving average shows negative 1.25 percent net salvage. Based on recent history and judgment, negative 1 percent net salvage for this account is recommended.
$\qquad$

## GENERAL PLANT VINTAGE GROUP (AMORTIZED) ACCOUNTS

The same net salvage parameters used for electric plant are proposed for amortized gas plant due to the similar operations and policies. The table below summarizes recommendations by account.

GAS AMORTIZED ACCOUNTS

| Acct | Description | Current Net Salvage | Proposed Net Salvage |
| :---: | :---: | :---: | :---: |
| Intangible |  |  |  |
| 303 | Computer Software - 5 Year | 0 | 0 |
| 303 | Computer Software - 10 Year | 0 | 0 |
| General Plant |  |  |  |
| 391 | Office Furniture \& Equipment | 0 | 0 |
| 391 | Network Equipment | 0 | 0 |

$\qquad$

## COMMON UTILITY PLANT DEPRECIATED ACCOUNTS General Accounts, FERC Account 390 <br> FERC Account 390 General Structures \& Improvements (proposed negative 25 percent net salvage)

This account includes any gross salvage or cost of removal associated with the cost of general structures and improvements used for utility service. The approved net salvage for this account is negative 20 percent. Net salvage data shows negative net salvage in most bands. The most recent 5 and 10 year averages are negative 23.43 percent and negative 41.13 percent respectively. A negative 25 percent net salvage for this account is recommended.

## FERC Account 390 General Structures \& Improvements - Leased (proposed zero percent net salvage)

This account includes any gross salvage or cost of removal associated with the cost of leasehold improvements used for utility service. The approved net salvage for this account is zero percent. There has been no retirement experience in this account. These assets typically have no net salvage. Based on judgment, retaining zero percent net salvage for this account is recommended.
