Re: In the Matter of Minnesota Power's 2019 Safety, Reliability and Service
Quality Standard Reports
Docket No. E015/M-19-254

Dear Mr. Wolf:

Minnesota Power hereby submits, via electronic filing, its Reply Comments in response to the Department of Commerce, Division of Energy Resources' Initial Comments in the above-referenced docket.

Please contact me at the number above with any questions related to this matter.

Respectfully,

A handwritten signature in black ink that reads "Jenna Warmuth".

**STATE OF MINNESOTA
BEFORE THE
MINNESOTA PUBLIC UTILITIES COMMISSION**

In the Matter of Minnesota Power's 2019
Annual Report Concerning Safety, Reliability,
Service Quality, and Proposed Annual Reliability Standards

Docket No: E015/M-19-254

REPLY COMMENTS

I. Introduction

The Department of Commerce - Division of Energy Resources (“Department”) released their Initial Comments on Minnesota Power’s (or, “the Company”) 2019 Safety, Reliability and Service Quality Report (“Report”) on June 7, 2019. The Department requested that the Company provide:

- Normalized and non-normalized CEMI values at outage levels of 4, 5, and 6.
- CELI values at 6 hours, 12 hours, and 24 hours. Since the Commission’s Order did not specify whether the Company should provide normalized or non-normalized data, the Department recommends that MP provide both.
- A clarification as to which components of MP’s filing were meant to fulfill the Commission’s directive to provide more discussion of leading causes of outages and mitigation strategies; if none was provided, MP should provide this discussion.
- A discussion of “what technologies are needed to advance tracking of additional metrics” to fulfill Order Point 4 of the Commission’s Order.

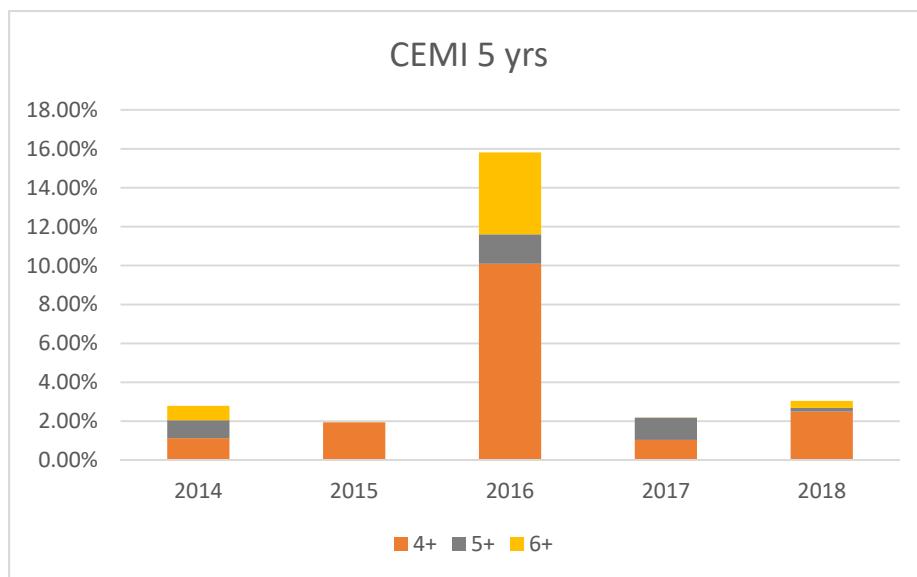

Additionally, the Department requested that in Reply Comments, Minnesota Power provide:

- An explanation of MP’s calculation of 2018 CAIDI values, given the stated SAIDI/SAIFI values;
- An explanation as to why MP’s rolling 5-year average values for 2014-2018 differ from the Department’s calculated values;
- Provide the underlying data and calculations behind MP’s Reliability by Customer Class figure;
- Comment on actions it has taken to improve the Colbyville 240 feeder, as well as any planned actions to prevent this circuit from causing problems in the future;
- Provide the specific number of calls received and calls answered within 20 seconds, both for business and non-business hours;
- Provide a breakdown of all calls received in 2018 by complaint/subject matter category;
- Provide a discussion of the best way that the Commission might measure and track data associated with new forms of self-service communication; and
- Confirm that the Department’s Required Deposits table is correct; or provide an updated table with correct values.

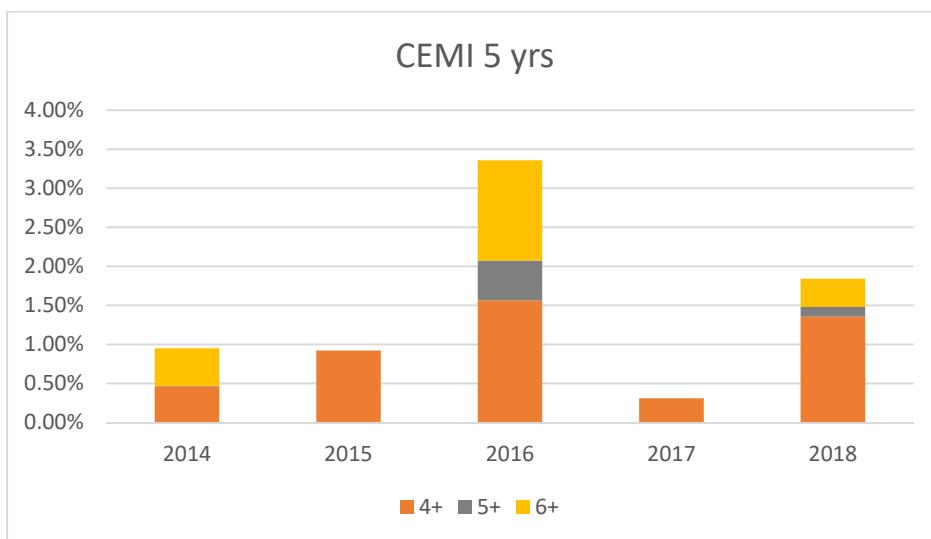

Section II of these Reply Comments addresses the Department’s requests for clarification and additional information.

II. Response to the Department

Normalized and non-normalized CEMI values at outage levels of 4, 5, and 6.

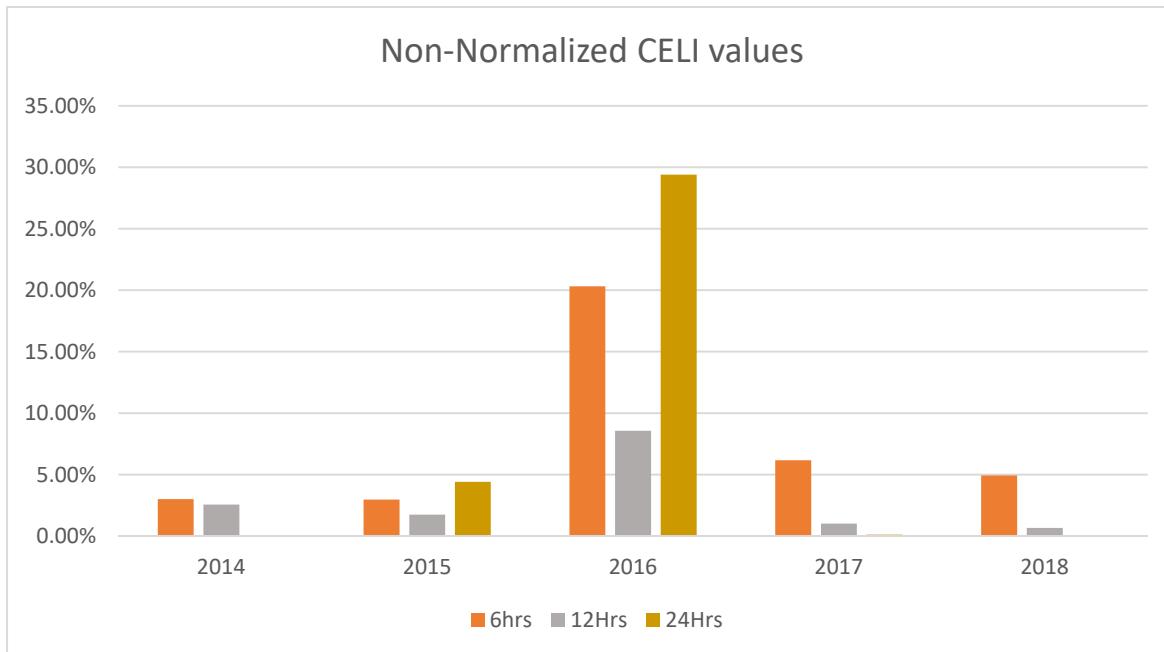

Normalized 4, 5, and 6 CEMI values:

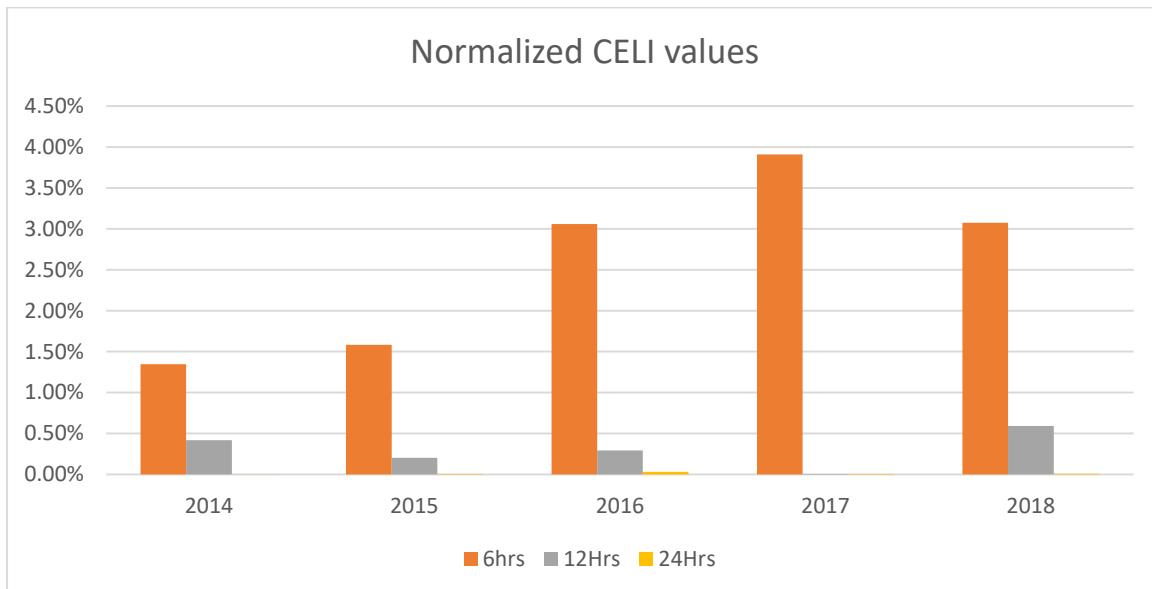

CELI values at 6 hours, 12 hours, and 24 hours, including normalized and non-normalized data

Non-Normalized 6, 12, and 24 hours CELI values:

Normalized 6, 12, and 24 hours CELI values:

A clarification as to which components of MP's filing were meant to fulfill the Commission's directive to provide more discussion of leading causes of outages and mitigation strategies; if none was provided, MP should provide this discussion.

As highlighted in the Company's original SRSQ Report in the docket, the main causes of outages for 2018 were weather and failed equipment. There are a number of improvements Minnesota Power is currently making or that are planned for future implementation.

One area of focus in 2020 will be storm-hardening projects on the distribution system. These projects will be focused on strategically undergrounding some of the Company's worst performing feeders. The areas where customers allow minimal tree trimming and where the Company has little to no access to the lines will be prioritized. By burying the overhead lines, the Company should experience a reduction in weather related tree contacts and lightning strikes.

The Company has made several advancements with regard to tracking and improving the frequency of failed equipment. Minnesota Power recently developed an application that allows any employee to identify areas of concern as employees are making observations on the system. The employee reports the issue by scanning a barcode placed on a pole and reporting the repairs/replacement needed. This application creates a service request and is followed up with a work order to prevent the issue from creating an outage in the future. In the last 18 months, the company has received over two thousand observations and has remedied over 70 percent of those observations. The Company expects to see rates of failed equipment decrease in future years as these issues are resolved.

The Company is expanding its preventative maintenance activities on distribution assets including switches, re-closers, regulators, and capacitor banks. By performing proactive maintenance on equipment the Company should have a reduced equipment failure rate and improved reliability. The company piloted a program for replacing re-closers with maintenance free trip savers and will expand the use of trip savers in 2019 and 2020. The trip savers are maintenance free and significantly cheaper than the older oil filled re-closers. The trip savers are also being installed to replace porcelain fused cutouts and will reduce failures and clear temporary faults, which results in improved reliability.

A discussion of "what technologies are needed to advance tracking of additional metrics".

As part of Minnesota Power's grid modernization initiatives, the Company has continued to expand its advanced metering infrastructure ("AMI") meter population and has also invested extensively in feeder monitoring and trip saver technology to provide information on feeder events as well as automated restoration of momentary outages.

Along with the AMI meter expansion, the Company is investing in a Meter Data Management (“MDM”) system that will be a repository for power quality issues and event logging. This information, as part of an organized software system coupled with geographic data, will highlight improvement areas for Minnesota Power’s system.

The Company also utilizes feeder sensors that provide data on feeder level events where traditional utility communications are lacking. The data set resulting from this monitoring will need to be linked to the Outage Management System (“OMS”) to fully utilize the capability of these sensors. This integration will take place over the next several years. The company is also installing fault indicators in addition to feeder sensors to give a better visual indication of where system faults are located. The feeder sensors are being used in conjunction with the fault indicators to reduce troubleshooting outages and increase restoration times.

As another part of the Company’s modernization plan, motor operated switches are being installed in increased levels on distribution feeders. In 2019, Minnesota Power is developing the process to use secure, existing communication to communicate with motor operators. With the expansion of motor operators, faulted sections of feeders will be isolated without rolling a truck. The use of these technologies will be expanded incrementally in the future.

An explanation of MP’s calculation of 2018 CAIDI values, given the stated SAIDI/SAIFI values;

The SAIDI and SAIFI values provided to the Commission in the Company’s SRSQ Report were rounded to two decimal places. Because of the rounding, the CAIDI values appeared skewed. Listed below are the SAIDI and SAIFI values not rounded and the calculated CAIDI value.

SAIDI	SAIFI	CAIDI
134.0037452657	1.3886433425	96.4997571121

An explanation as to why MP’s rolling 5-year average values for 2014-2018 differ from the Department’s calculated values;

The 5 year averages for SAIDI, SAIFI, and calculated CAIDI values provided to the Commission have excluded 2016 values since the 2017 request to remove the 2016 data from the average calculations. To stay in line with previous filings, we have excluded 2016 values in our 5 year averages calculation for the 2019 targets. Listed below are the SAIDI, SAIFI and calculated CAIDI values rounded to 4 decimal places and the associated averages from 2014-2018 without excluding 2016 values.

YEAR	SAIDI	SAIFI	CAIDI
2014	88.3527	0.9553	92.4911
2015	101.8197	1.1713	86.9322
2016	122.6924	1.2861	95.3958
2017	108.0604	1.0401	103.8968
2018	134.0037	1.3886	96.4998
Averages	110.9858	1.1683	94.9998

Provide the underlying data and calculations behind MP's Reliability by Customer Class figure;

Please see attachment "Reliability by Customer Class" for the underlying data.

Comment on actions it has taken to improve the Colbyville 240 feeder, as well as any planned actions to prevent this circuit from causing problems in the future;

The Colbyville 240 (COL-240) feeder has been an area of focused improvement for Minnesota Power. In 2017 and 2018, two miles of an adjacent feeder were upgraded to a larger conductor size in order to carry the COL-240 feeder during an outage event. Three gang operated switches¹ were also replaced on this feeder.

In 2018, COL-240 went under an extensive engineering review to improve reliability. As a result of this review, 29 Faulted Circuit Indicators ("FCIs"), 3 smart feeder sensors, 2 new switches, and 12 trip savers were installed. Part of this feeder was rebalanced and transferred to an adjacent feeder to provide Minnesota Power more switching opportunities. The FCIs and feeder sensors will give the line personnel better indication of where a fault is located and should decrease restoration times during an event. The trip savers installed on single phase taps will clear temporary faults, such as wildlife and lightning, without causing a sustained outage, which in turn will prevent truck rolls and improve reliability.

The company is currently working on a pilot to install motor operated switches on this feeder in 2020. These remote operated switches will allow us to isolate faulted sections of the feeder and restore customers more rapidly without having to roll a truck and dispatch line personnel.

¹ Three separate switches for each phase are operated as a group from a single control; "air-break" because the switch operates in air rather than in another medium, such as oil

Provide the specific number of calls received and calls answered within 20 seconds, both for business and non-business hours;

Please refer to the tables below for the number of calls received and calls answered within 20 seconds for both business and non-business hours. Consistent with prior SRSQ reporting, Minnesota Power defines business hours as 7:00 am to 5:30 pm, Monday through Friday, excluding holidays.

Month 2018	Response Time	Total Calls	Calls Answered within 20 seconds
JANUARY	71%	11,348	8,038
FEBRUARY	84%	9,318	7,822
MARCH	84%	10,768	8,998
APRIL	82%	11,152	9,196
MAY	79%	13,630	10,732
JUNE	76%	13,879	10,552
JULY	87%	13,142	11,436
AUGUST	76%	13,572	10,303
SEPTEMBER	88%	11,259	9,881
OCTOBER	77%	13,595	10,456
NOVEMBER	86%	10,501	9,003
DECEMBER	89%	8,536	7,585
YTD		140,700	114,002

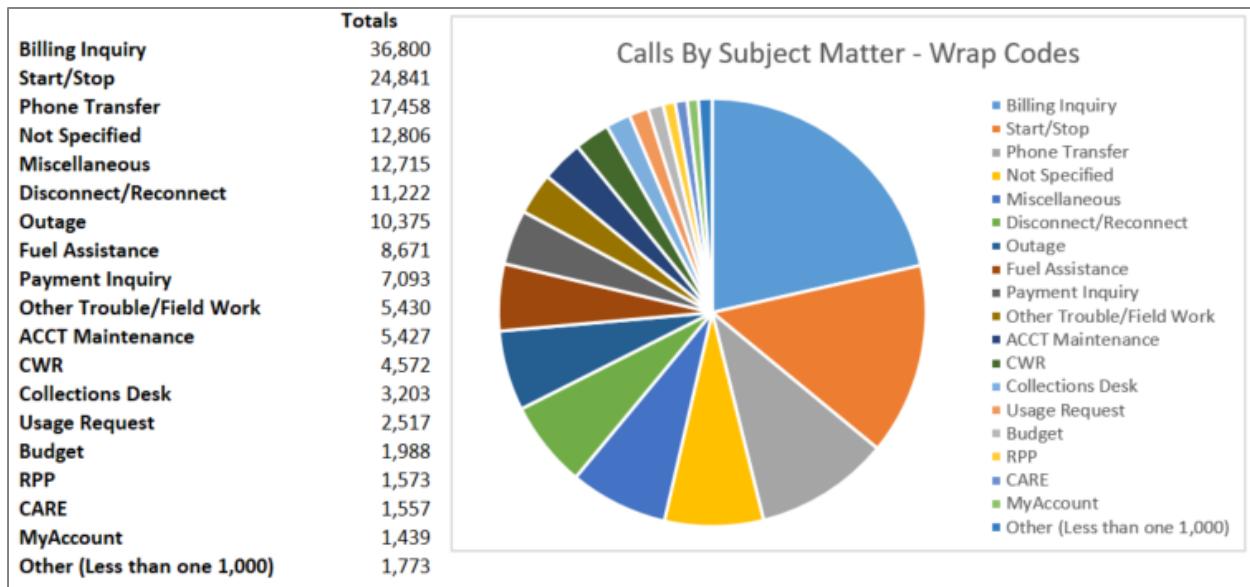

Business Hours 7:00 a.m. - 5:30 p.m.

Month 2018	Response Time	Total Calls	Calls Answered within 20 seconds
JANUARY	71%	1,104	779
FEBRUARY	73%	907	659
MARCH	67%	1,038	693
APRIL	66%	1,190	785
MAY	70%	1,426	1,003
JUNE	64%	1,841	1,183
JULY	60%	1,283	856
AUGUST	64%	1,425	919
SEPTEMBER	65%	1,448	942
OCTOBER	63%	1,197	758
NOVEMBER	73%	870	631
DECEMBER	74%	886	653
YTD		14,615	9,861

After Hours 5:30 p.m. - 7:00 a.m.

Provide a breakdown of all calls received in 2018 by complaint/subject matter category;

The figure below provides a breakdown of calls received in 2018 by subject matter category. This breakdown is based on the wrap codes that are used by representatives when closing and documenting a call. Calls may cover a range of topics, so the primary subject matter is determined subjectively by each representative. Please note that the total number of calls and the number of wrap codes do not reconcile as multiple representatives may handle a single call and each would choose a wrap code according to their role in addressing the customer inquiry. The Phone Transfer and Not Specified categories generally relate to calls where a representative with primarily operator responsibilities transferred the call or the caller requested to be transferred. Details regarding customer complaints are on pages 36-38 of Appendix A in the 2019 SRSQ Report.

Provide a discussion of the best way that the Commission might measure and track data associated with new forms of self-service communication; and

As discussed in Appendix A of the 2019 SRSQ Report and in responses to Information Requests 1 and 2 from the Minnesota Public Utilities Commission in its 2018 SRSQ Report,² Minnesota Power suggests that customer expectations and preferences regarding communication channels will ultimately need to be a point of consideration and review as part of service quality reporting. Minnesota Power observes there are multiple customer touchpoints, one of which is phone calls, and varied ways of contacting and responding to customers, and for customers to reach out to the Company.

There are important transformations in systems, technology and new rate offerings that Minnesota Rules do not reflect. This includes additional channels for two-way communication between utilities and customers, such as social media and other outlets, to provide timely updates on outages. Further, as AMI and time-of-day rate offerings become more predominant, meter reading and communications infrastructure are changing. Also, mobile workforce tools and online outage applications are pertinent, but not reflected in the rules or standards. While there is nothing that prevents a utility from sharing updates regarding other channels, features, or emerging technology, the current service quality rules focus largely on a specific channel for customer interactions, that being voice communications through a dedicated Call Center. The Call Center has been and will continue to be an important channel for customers, but it is becoming one of several. As more self-service options become available to customers, the types of calls that the Call Center receives will likely become predominantly more complex and time-consuming, as other

² Docket No. E015/M-18-250

channels will be used to address high call volume subject matters such as billing inquiries and transferring service. This will put pressure on the response time metrics and will inevitably challenge traditional approaches and views regarding how response times are measured and what the appropriate success metrics might be going forward. If not included as part of service quality metrics more holistically, it may lead to inaccurate conclusions regarding responsiveness to customers. As this situation is not unique to Minnesota Power, the input of other utilities and stakeholders is required for a formal update to the metrics. Each utility has unique offerings and service territories, as well as unique systems and reporting capabilities, which will be important factors in determining how best to measure and track data associated with new forms of self-service communication.

Confirm that the Department's Required Deposits table is correct; or provide an updated table with correct values.

Yes, the Department's "Table 13. MP's Required Deposits" in their reply comments is correct.

III. Conclusion

Minnesota Power appreciates the opportunity to respond to the Department's requests for further information and clarification. Modernization of the electric grid and customer service offerings present new and multifaceted challenges and opportunities for utilities, stakeholders, and the Commission alike. As we move towards the future, a holistic conversation on appropriate and accurate metrics is increasingly necessary. The Company looks forward to continuing these important conversations with stakeholders.
